

SWATH2stats example script

Example R code showing the usage of the SWATH2stats package. The data processed is the publicly available dataset of *S.pyogenes* (Röst et al. 2014) (<http://www.peptideatlas.org/PASS/PASS00289>). The results file ‘rawOpenSwathResults_1pcnt_only.tsv’ can be found on PeptideAtlas (<ftp://PASS00289@ftp.peptideatlas.org/..../Spyogenes/results/>). This is a R Markdown file, showing the result of processing this data. The lines shaded in grey represent the R code executed during this analysis.

The SWATH2stats package can be directly installed from Bioconductor using the commands below (<http://bioconductor.org/packages/devel/bioc/html/SWATH2stats.html>).

```
if (!require("BiocManager"))
  install.packages("BiocManager")
BiocManager::install("SWATH2stats")
```

Part 1: Loading and annotation

Load the SWATH-MS example data from the package, this is a reduced file in order to limit the file size of the package.

```
library(SWATH2stats)
library(data.table)
data('Spyogenes', package = 'SWATH2stats')
```

Alternatively the original file downloaded from the Peptide Atlas can be loaded from the working directory.

```
data <- data.frame(fread('rawOpenSwathResults_1pcnt_only.tsv', sep='\t', header=TRUE))
```

Extract the study design information from the file names. Alternatively, the study design table can be provided as an external table.

```
Study_design <- data.frame(Filename = unique(data$align_origfilename))
Study_design$Filename <- gsub(".*strep_align/(.*)_all_peakgroups.*", "\\\1", Study_design$Filename)
Study_design$Condition <- gsub("(Strep.*)_Repl.*", "\\\1", Study_design$Filename)
Study_design$BioReplicate <- gsub(".*Repl([[:digit:]])_.*", "\\\1", Study_design$Filename)
Study_design$Run <- seq_len(nrow(Study_design))
head(Study_design)
```

```
##                                     Filename Condition BioReplicate Run
## 1 Strep0_Repl1_R02/split_hroest_K120808    Strep0            1   1
## 2 Strep0_Repl2_R02/split_hroest_K120808    Strep0            2   2
## 3 Strep10_Repl1_R02/split_hroest_K120808   Strep10           1   3
## 4 Strep10_Repl2_R02/split_hroest_K120808   Strep10           2   4
```

The SWATH-MS data is annotated using the study design table.

```
data.annotated <- sample_annotation(data, Study_design, column_file = "align_origfilename")
```

Remove the decoy peptides for a subsequent inspection of the data.

```
data.annotated.nodecoy <- subset(data.annotated, decoy==FALSE)
```

Part 2: Analyze correlation, variation and signal

Count the different analytes for the different injections.

```
count_analytes(data.annotated.nodecoy)
```

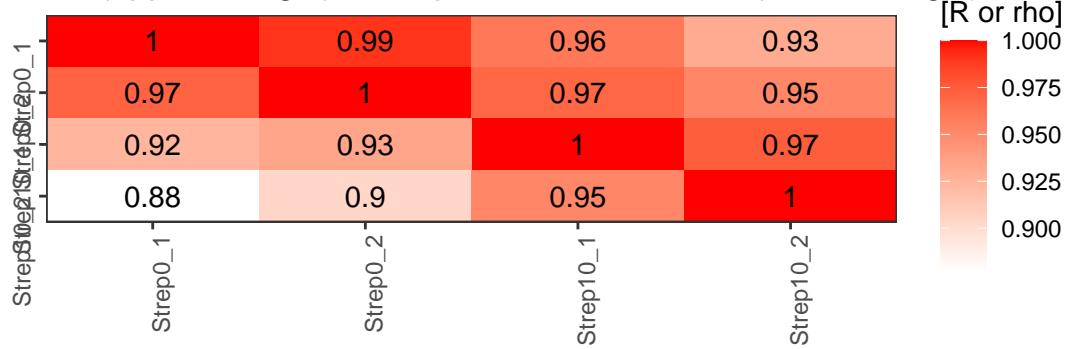

```
##      run_id transition_group_id FullPeptideName ProteinName
## 1  Strep0_1_1              10229        8377       1031
## 2  Strep0_2_2              9716         7970       1003
## 3 Strep10_1_3             8692         7138       943
## 4 Strep10_2_4             8424         6941       910
```

Plot the correlation of the signal intensity.

```
correlation <- plot_correlation_between_samples(data.annotated.nodecoy, column.values = 'Intensity')

## Warning: Use of `data.plot$value` is discouraged. Use `value` instead.
```

Intensity correlation between samples:
Pearson (upper triangle) and Spearman correlation (lower triangle)

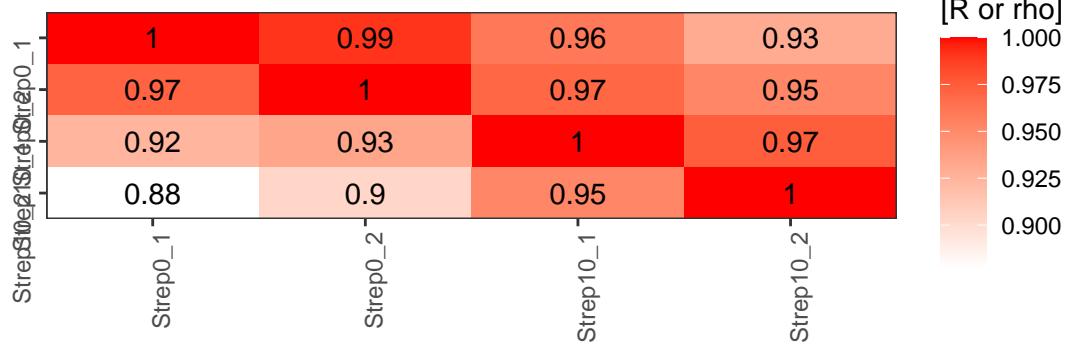

Plot the correlation of the delta_rt, which is the deviation of the retention time from the expected retention time.

```
correlation <- plot_correlation_between_samples(data.annotated.nodecoy, column.values = 'delta_rt')

## Warning: Use of `data.plot$value` is discouraged. Use `value` instead.
```

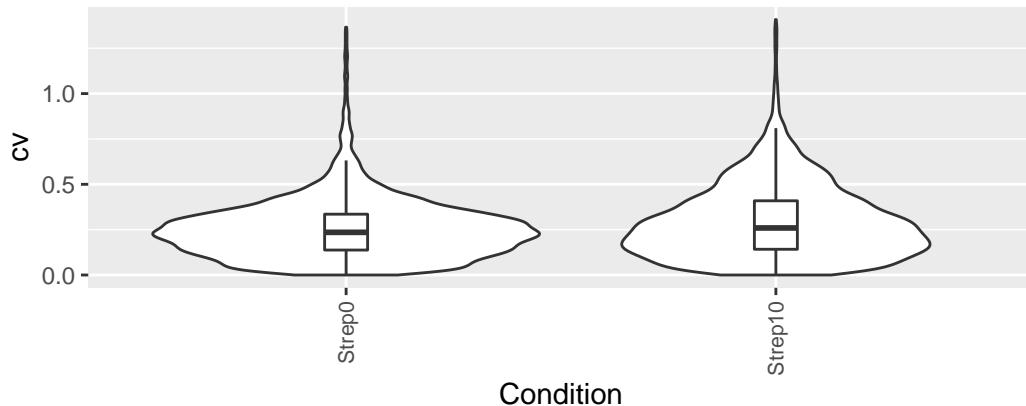

Intensity correlation between samples:
Pearson (upper triangle) and Spearman correlation (lower triangle)

Plot the variation of the signal across replicates.

```
variation <- plot_variation(data.annotated.nodecoy)
```

cv across conditions

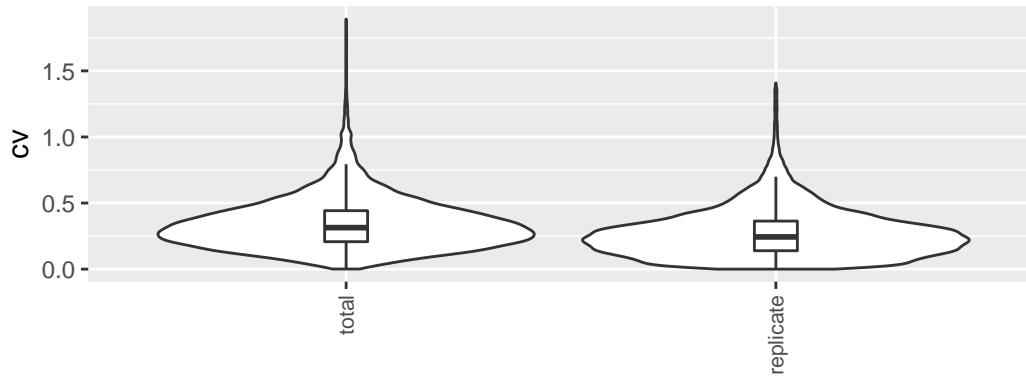

```
variation[[2]]
```

```
##   Condition   mode_cv   mean_cv median_cv
## 1    Strep0 0.2280372 0.2545450 0.2351859
## 2    Strep10 0.1706934 0.2947144 0.2592725
```

Plot the total variation versus variation within replicates.

```
variation_total <- plot_variation_vs_total(data.annotated.nodecoy)
```

coefficient of variation – total versus within replicates

```
variation_total[[2]]
```

```
##      scope   mode_cv   mean_cv median_cv
## 1 replicate 0.2209867 0.2728681 0.2438041
## 2      total 0.2655678 0.3439050 0.3139993
```

Calculate the summed signal per peptide and protein across samples.

```
peptide_signal <- write_matrix_peptides(data.annotated.nodecoy)
protein_signal <- write_matrix_proteins(data.annotated.nodecoy)
head(protein_signal)
```

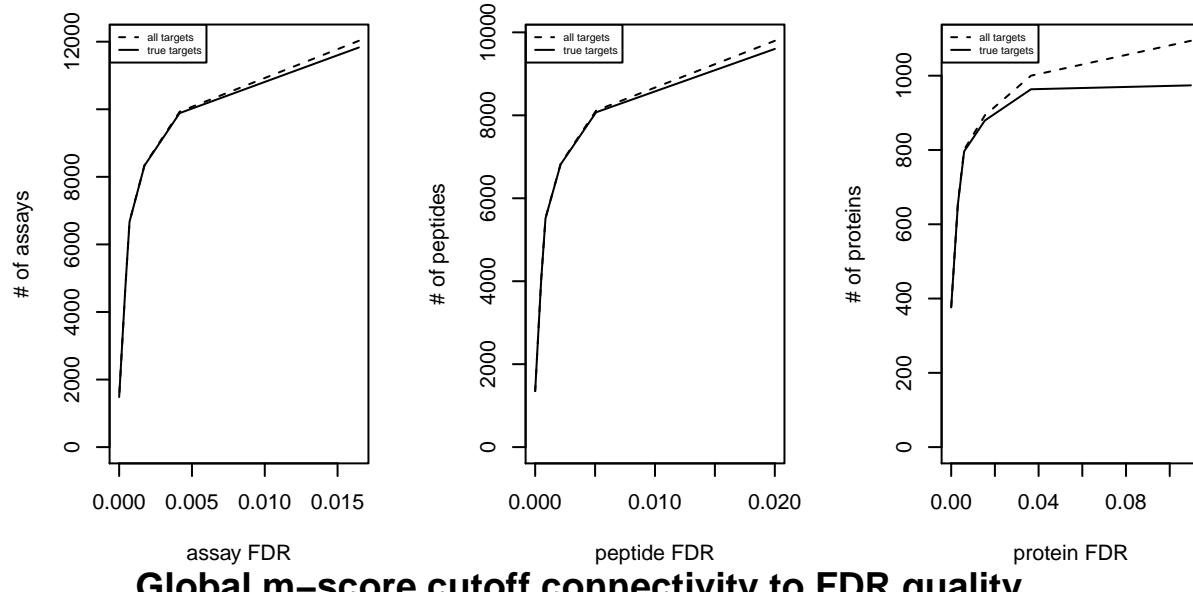

```
##                               ProteinName Strep0_1_1 Strep0_2_2 Strep10_1_3 Strep10_2_4
## 1 Spy0_Ex3652_DDB_SeqID_1571119      265206     163326      51831      45021
## 2 Spy0_Ex3652_DDB_SeqID_1579753      185725     150672      21483     144314
```

```
## 3 Spyo_Exp3652_DDB_SeqID_1631459      176686      132415      42165      32735
## 4 Spyo_Exp3652_DDB_SeqID_1640263      3310        6617      98550      45169
## 5 Spyo_Exp3652_DDB_SeqID_1709452      852502      747772      503581      504761
## 6 Spyo_Exp3652_DDB_SeqID_17244480     17506       29578      7607       2482
```

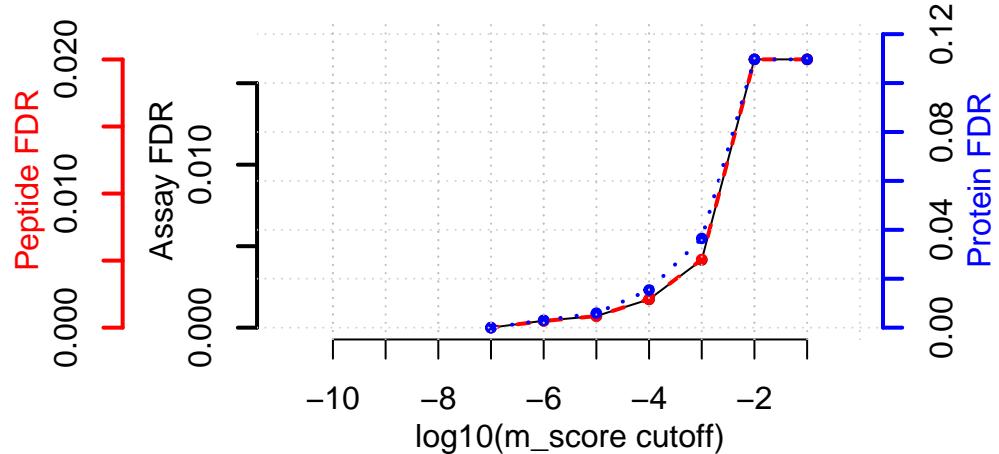

Part 3: FDR estimation

Estimate the overall FDR across runs using a target decoy strategy.

```
par(mfrow = c(1, 3))
fdr_target_decoy <- assess_fdr_overall(data.annotated, n_range = 10,
                                         FFT = 0.25, output = 'Rconsole')
```

Global m-score cutoff connectivity to FDR quality

According to this

FDR estimation one would need to filter the data with a lower mscore threshold to reach an overall protein FDR of 5%.

```
mscore4protfdr(data, FFT = 0.25, fdr_target = 0.05)
```

```
## Target protein FDR:0.05
## Required overall m-score cutoff:0.0017783
## achieving protein FDR =0.0488
## [1] 0.001778279
```

Part 4: Filtering

Filter data for values that pass the 0.001 mscore criteria in at least two replicates of one condition.

```
data.filtered <- filter_mscore_condition(data.annotated, 0.001, n_replica = 2)
```

```
## Fraction of peptides selected: 0.67
```

```
## Dimension difference: 7226, 0
```

Select only the 10 peptides showing strongest signal per protein.

```
data.filtered2 <- filter_on_max_peptides(data.filtered, n_peptides = 10)
```

```
## Before filtering:
```

```
##   Number of proteins: 884
```

```
##   Number of peptides: 6594
```

```
##
```

```
## Percentage of peptides removed: 29.6%
```

```
##
```

```
## After filtering:
```

```
##   Number of proteins: 884
```

```
##   Number of peptides: 4642
```

Filter for proteins that are supported by at least two peptides.

```
data.filtered3 <- filter_on_min_peptides(data.filtered2, n_peptides = 2)

## Before filtering:
##   Number of proteins: 884
##   Number of peptides: 4642
##
## Percentage of peptides removed: 3.6%
##
## After filtering:
##   Number of proteins: 717
##   Number of peptides: 4475
```

Part 5: Conversion

Convert the data into a transition-level format (one row per transition measured).

```
data.transition <- disaggregate(data.filtered3)

## The library contains 6 transitions per precursor.
##
## The data table was transformed into a table containing one row per transition.

Convert the data into the format required by MSstats.

MSstats.input <- convert4MSstats(data.transition)

## One or several columns required by MSstats were not in the data.
##           The columns were created and filled with NAs.
## Missing columns: ProductCharge, IsotopeLabelType
## IsotopeLabelType was filled with light.

## Warning in convert4MSstats(data.transition): Intensity values that were 0, were
## replaced by NA

head(MSstats.input)
```

```
