1 Introduction

KEGG is the Kyoto Encyclopedia of Genes and Genomes. An important product of the KEGG group is a catalog of pathways. The KEGG Orthology (KO) organizes the pathways into a conceptual hierarchy. This package encodes the hierarchy as a graph, and provides some support for deriving sets of array feature identifiers from the hierarchy.

2 K0graph

```
> library(keggorthology)
> library(graph)
> data(K0graph)
> K0graph
```

A graphNEL graph with directed edges
Number of Nodes = 358
Number of Edges = 357

```
> nodes(K0graph)[1:5]
```

```
[1] "KO.Feb10root"           "Metabolism"
[3] "Carbohydrate Metabolism" "Glycolysis / Gluconeogenesis"
[5] "Citrate cycle (TCA cycle)"
```

The upper component of the hierarchy is:

```
> adj(KOgraph, nodes(KOgraph)[1])
```

```
$KO.Feb10root
[1] "Metabolism"
[2] "Genetic Information Processing"
[3] "Environmental Information Processing"
[4] "Cellular Processes"
[5] "Organismal Systems"
[6] "Human Diseases"
```

Graph operations can be used to explore the orthology. For example, the context of the PPAR signaling pathway is found as follows:

```
> library(RBGL)
> sp.between(KOgraph, nodes(KOgraph)[1], "PPAR signaling pathway")

$`KO.Feb10root:PPAR signaling pathway`$length
[1] 3

$`KO.Feb10root:PPAR signaling pathway`$path_detail
[1] "KO.Feb10root"           "Organismal Systems"      "Endocrine System"
[4] "PPAR signaling pathway"

$`KO.Feb10root:PPAR signaling pathway`$length_detail
$`KO.Feb10root:PPAR signaling pathway`$length_detail[[1]]
    KO.Feb10root->Organismal Systems
                           1
    Organismal Systems->Endocrine System
                           1
    Endocrine System->PPAR signaling pathway
                           1
```

Fixed-length identifiers are used to label pathways. These are available as the 'tag' nodeData attribute.

```
> nodeData(KOgraph, , "tag") [1:5]
```

```
$KO.Feb10root  
[1] "NONE"  
  
$Metabolism  
[1] "01100"  
  
$`Carbohydrate Metabolism`  
[1] "01101"  
  
$`Glycolysis / Gluconeogenesis`  
[1] "00010"  
  
$`Citrate cycle (TCA cycle)`  
[1] "00020"
```

The depth of each term is also available.

```
> nodeData(KOgraph, , "depth") [1:5]
```

```
$KO.Feb10root  
[1] 0
```

```
$Metabolism  
[1] 1  
  
$`Carbohydrate Metabolism`  
[1] 2  
  
$`Glycolysis / Gluconeogenesis`  
[1] 3  
  
$`Citrate cycle (TCA cycle)`  
[1] 3
```

3 Application to gene filtering

Several functions are available for retrieving relevant information from the orthology. If you know a substring of the pathway name of interest, you can obtain the numerical tag(s).

```
> getKOtags("insulin")  
  
Insulin signaling pathway  
"04910"
```

We can get probe set identifiers corresponding to a term. The default chip annotation package used is hgu95av2.db.

```
> library(hgu95av2.db)
> mp = getK0probes("Methionine")
> library(ALL)
> data(ALL)
> ALL[mp,]

ExpressionSet (storageMode: lockedEnvironment)
assayData: 32 features, 128 samples
  element names: exprs
  protocolData: none
  phenoData
    sampleNames: 01005 01010 ... LAL4 (128 total)
    varLabels: cod diagnosis ... date last seen (21 total)
    varMetadata: labelDescription
  featureData: none
  experimentData: use 'experimentData(object)'
  pubMedIds: 14684422 16243790
  Annotation: hgu95av2
```

4 Infrastructure considerations

Based on keggorthology read of KEGG orthology, March 2 2010. Specifically, we run wget on `ftp://ftp.genome.jp/pub/kegg/brite/ko/ko00001.keg` and use parsing and modeling code given in `inst/keggHTML` to generate a data frame respecting the hierarchy, and then `keggDF2graph` function in `keggorthology` package to construct the graph.
