1 Introduction

In this document we illustrate import of FASTA files, simple alignments, and consensus matrix calculation.

2 Data import

The *Biostrings* package includes FASTA files encoding the DNA sequence for Yeast chromosome I, along with some ORFs. Here we load the `someORF.fsa` file into a *BStringViews* object using the `read.BStringViews` function:

```
> library(Biostrings)
> file <- system.file("Exfiles", "someORF.fsa", package = "Biostrings")
> orf <- read.BStringViews(file, "fasta", "DNAString")
> orf

> desc(orf)

[1] "YAL001C TFC3 SGDID:S0000001, Chr I from 152168-146596, reverse complement, Verified ORF"
[2] "YAL002W VPS8 SGDID:S0000002, Chr I from 142709-148533, Verified ORF"
[3] "YAL003W EFB1 SGDID:S0000003, Chr I from 141176-144162, Verified ORF"
[4] "YAL005C SSA1 SGDID:S0000004, Chr I from 142433-138505, reverse complement, Verified ORF"
[5] "YAL007C ERP2 SGDID:S0000005, Chr I from 139347-136700, reverse complement, Verified ORF"
[6] "YAL008W FUN14 SGDID:S0000006, Chr I from 135916-138512, Verified ORF"
[7] "YAL009W SP07 SGDID:S0000007, Chr I from 134856-137635, Verified ORF"

```

Note that some of the ORF sequences are represented in reverse complement form.

3 Alignments

A very simple implementation of the Needleman-Wunsch global alignment algorithm is provided. This takes space proportional to the square of the string length, uses a simple scalar gap penalty, and requires a substitution scoring matrix appropriate for the alphabets from which the strings to be aligned are constructed. Pattern alphabet concepts are not currently used.

The BLOSUM50 matrix is available in this package as a matrix:

```

> data(BLOSUM50)
> BLOSUM50[1:4, 1:4]

```

	A	R	N	D
A	5	-2	-1	-2
R	-2	7	-1	-2
N	-1	-1	7	2
D	-2	-2	2	8

A canonical example from Durbin, Eddy et al:

```

> nwdemo <- needwunsQS("PAWHEAE", "HEAGAWGHEE", BLOSUM50)
> nwdemo

align1: --P-AW-HEAE
align2: HEAGAWGHE-E
score: 1

```

The score (final element of dynamic programming score matrix) can be accessed:

```
> score(nwdemo)
```

```
[1] 1
```

4 Computing alignment consensus matrices

The `consmat` function is provided for computing a consensus matrix for a set of equal-length strings assumed to be aligned. To illustrate, the following application assumes the ORF data to be aligned for the first 10 positions (patently false):

```
> orf10 <- subviews(orf, 1, 10)
> consmat(orf10)
```

letter	pos	1	2	3	4	5	6	7
A	0.2857143	0.2857143	0.2857143	0.0000000	0.5714286	0.4285714	0.4285714	
C	0.4285714	0.1428571	0.2857143	0.2857143	0.2857143	0.1428571	0.0000000	
G	0.1428571	0.1428571	0.1428571	0.2857143	0.1428571	0.0000000	0.4285714	
T	0.1428571	0.4285714	0.2857143	0.4285714	0.0000000	0.4285714	0.1428571	

letter	pos	8	9	10
A	0.4285714	0.2857143	0.1428571	
C	0.0000000	0.2857143	0.4285714	
G	0.4285714	0.1428571	0.2857143	
T	0.1428571	0.2857143	0.1428571	

The information content as defined by Hertz and Stormo 1995 is computed as follows:

```
> infContent <- function(Lmers) {
+   zlog <- function(x) ifelse(x == 0, 0, log(x))
+   co <- consmat(Lmers, freq = TRUE)
+   lets <- rownames(co)
+   fr <- alphabetFrequency(Lmers)[lets]
+   sum(co * zlog(co/fr))
+ }
> infContent(orf10)
```

```
[1] -40.31777
```
