1 Introduction

This is a short tour on the `DNAString` function vectorization feature.

Feel free to add your own comments.

2 DNAString vs BStringViews

The `Biostrings2Classes` vignette presents a proposal for 2 new classes (`BString` and `BStringViews`) as a replacement for the `BioString` class currently defined in the `Biostrings 1` (`Biostrings v 1.4.x`) package.

It also shows how to use the `DNAString` function to create a `DNAString` object (a `DNAString` object is just a particular case of a `BString` object):

```
> d <- DNAString("TTGAAAA-CTC-N")
```

However this function is NOT vectorized: it always returns a `DNAString` object (which can only represent a *single* string).

In `Biostrings 1`, the `DNAString` function IS vectorized. Its vectorized form does the following: (1) concats the elements of its `src` argument into a single big string, (2) stores the offsets of all these elements in the `offsets` slot.

This behaviour is not immediatly obvious to the user, until he looks at the `offsets` slot.

It always returns a *BioString* object (with has as many values as the number of elements passed in the `src` argument).

3 The `BStringViews` generic function

The feature described in the previous section (provided by the vectorized form of the `DNAString` function in *Biostrings* 1) is provided in *Biostrings* 2 via the `BStringViews` generic function:

```
> v <- BStringViews(c("TTGAAAA-C", "TC-N"), "DNAString")
> v

  Views on a 13-letter DNAString subject
Subject: TTGAAAA-CTC-N
Views:
  start end width
[1]     1   9     9 [TTGAAAA-C]
[2]    10  13     4 [TC-N]
```

4 Performance

The following example was provided by Wolfgang:

```
> library(hgu95av2probe)

> system.time(z <- BStringViews(hgu95av2probe$sequence, "DNAString"))

  user  system elapsed
 3.912   0.040   3.952

> z

  Views on a 5045000-letter DNAString subject
Subject: TGGCTCCTGCTGAGGTCCCCTTCCGGCTGTGAA...AAGCCCTCGTGCTCCTGTCAACAGCGCACCCA
Views:
  start end width
[1]     1   25    25 [TGGCTCCTGCTGAGGTCCCCTTCC]
[2]    26   50    25 [GGCTGTGAATTCCCTGTACATATTTC]
[3]    51   75    25 [GCTTCAATTCCATTATGTTTAATG]
[4]    76  100    25 [GCCGTTGACAGAGCATGCTCTGCG]
[5]   101  125    25 [TGACAGAGCATGCTCTGCCTGTTG]
[6]   126  150    25 [CTCTGCCTGTTGGTTTCACCAGCT]
[7]   151  175    25 [GGTTTCACCAGCTTCTGCCCTCACA]
[8]   176  200    25 [TTCTGCCCTCACATGCACAGGGATT]
[9]   201  225    25 [CCTCACATGCACAGGGATTAAACAA]
...
[201792] 5044776 5044800    25 [GAGTGCCAATTGATGATGAGTCAG]
```

```
[201793] 5044801 5044825    25 [ACACTGACACTTGTGCTCCTTGTCA]
[201794] 5044826 5044850    25 [CAATTGATGATGAGTCAGCAACTG]
[201795] 5044851 5044875    25 [GACTTCTGAGGAGATGGATAGCCT]
[201796] 5044876 5044900    25 [AGATGGATAGCCTTCTGTCAAAGCA]
[201797] 5044901 5044925    25 [ATAGCCTTCTGTCAAAGCATCATCT]
[201798] 5044926 5044950    25 [TTCTGTCAAAGCATCATCTAACAA]
[201799] 5044951 5044975    25 [CAAAGCATCATCTCAACAAGCCCTC]
[201800] 5044976 5045000    25 [GTGCTCCTTGTCAAACAGCGCACCCA]
```

With *Biostrings* 1, the call to `DNAString(hgu95av2probe$sequence)` takes about 20 minutes... (the implementation of the vectorization feature is quadratic in time, as reported by Wolfgang).

5 Loading a FASTA file into a *BStringViews* object

The `read.BStringViews` function can be used to load a FASTA file in a *BStringViews* object:

```
> file <- system.file("Exfiles", "someORF.fsa", package = "Biostrings")
> orf <- read.BStringViews(file, "fasta", "DNAString")
> orf

  Views on a 26339-letter DNAString subject

```

6 Switching between DNA and RNA views

The `BStringViews` function can also be used to switch between “DNA” and “RNA” views on the same string:

```
> orf2 <- BStringViews(orf, "RNAString")
```

These conversions are very fast because no string data needs to be copied:

```
> orf[[0]]@data
```

```
26339-byte XRaw object (starting at address 0x3384298)
```

```
> orf2[[0]]@data
```

```
26339-byte XRaw object (starting at address 0x3384298)
```
