`barploterrbar`      *Barplot with error bars.*

---

## Description

Barplot with error bars.

## Usage

```
barploterrbar(y, yl, yh, barcol="orange", errcol="black", horiz=FALSE,
w=0.2, theCut=NULL, columnForDiffBars=TRUE, cex.axis =
par("cex.axis"), zeroForNA=TRUE, legend=FALSE, groups = NULL, order=FALSE, ...)
```

## Arguments

<code>y</code>	Numeric vector.
<code>yl</code>	Numeric vector of same length as <code>y</code> .
<code>yh</code>	Numeric vector of same length as <code>y</code> .
<code>barcol</code>	Color of the bars.
<code>errcol</code>	Color of the error bars.
<code>horiz</code>	Logical. As in <code>barplot</code> .
<code>w</code>	Size of the error bar ticks.
<code>theCut</code>	
<code>columnForDiffBars</code>	
<code>zeroForNA</code>	
<code>cex.axis</code>	
<code>legend</code>	Should a legend be plotted ?
<code>groups</code>	a factor - if specified the bars are colored according to the group they belong to
<code>order</code>	plot sample values in descending order
<code>...</code>	Further arguments that get passed on to <code>barplot</code> .

## Details

The function calls `barplot` with `y` and decorates it with error bars according to `yl` and `yh`.

**Value**

The function is called for its side effect, producing a plot.

**Author(s)**

Markus Ruschhaupt, Florian Hahne

**See Also**

[barplot](#)

**Examples**

```
y <- matrix(runif(80), ncol=5)
ym <- apply(y, 2, mean)
dy <- apply(y, 2, sd)*2/sqrt(nrow(y))
barploterrbar(ym, ym-dy, ym+dy, barcol="#0000c0", errcol="orange")
```

---

ddCtAbsolute

*absolute quantification for Taqman data*

---

**Description**

absolute quantification for Taqman data

**Usage**

```
ddCtAbsolute(raw.table, addData, type = "mean", ADD = -30.234, DIV = -1.6268, sa
```

**Arguments**

raw.table	data frame. It must contain columns with the following names: 'Ct', 'Sample', 'Detector', 'Platename'. The column 'Ct' must contain numeric values.
addData	
type	character of length 1. 'mean' or 'median' - which method should be used for the aggregation of the replicates
ADD	
DIV	
sampleInformation	if specified it must be an object of class <code>phenoData</code> with a column named 'Sample'.
toZero	boolean - if there is only one replication should the error be treated as zero ? (only if 'type' is mean)
filename	character of length 1. The name of the file the warnings should be stored in.

**Value**

A an object of class `eSet`. The assayData has the following components: `exprs`, `error`, `Ct`, `Ct.error`, `Difference`, `number\_NA`, `number`, `Plate`.

**Author(s)**

Markus Ruschhaupt <mailto:m.ruschhaupt@dkfz.de>

---

ddCtExpression-class  
*ddCt Expression*

---

**Description**

This class is a subclass of `ExpressionSet` and represents objects which are produced by the `ddCt` algorithm in the `ddCtExpression` method

**Extends**

Class `ExpressionSet`, directly. Class `eSet`, by class "ExpressionSet", distance 2. Class `VersionedBiobase`, by class "ExpressionSet", distance 3. Class `Versioned`, by class "ExpressionSet", distance 4.

**Methods**

**Ct** signature(object = "ddCtExpression"): returns the Ct value of this ddCtExpressionobject

**CtErr** signature(object = "ddCtExpression"): returns the error number of the Ct value of this ddCtExpressionobject

**dCt** signature(object = "ddCtExpression"): returns the dCt value of this ddCtExpressionobject

**dCtErr** signature(object = "ddCtExpression"): returns the error number of the dCt value of this ddCtExpressionobject

**ddCt** signature(object = "ddCtExpression"): returns the ddCt value of this ddCtExpressionobject

**ddCtErr** signature(object = "ddCtExpression"): returns the error number of the ddCt value of this ddCtExpressionobject

**level** signature(object = "ddCtExpression"): returns the levels in this ddCtExpressionobject

**levelErr** signature(object = "ddCtExpression"): returns the error number of the levels in this ddCtExpressionobject

**numberCt** signature(object = "ddCtExpression"): returns the Ct number of this ddCtExpressionobject

**numberNA** signature(object = "ddCtExpression"): returns the NA number of this ddCtExpressionobject

**elist** signature(object = "ddCtExpression"): returns a data frame which represents this expression object

**elistWrite** signature(object = "ddCtExpression", file = "character"): writes ddCtExpression object into a file

**Author(s)**

Rudolf Biczok <mailto:r.biczok@dkfz.de>

**See Also**

[SDMFrame](#): reader for SDM files [elist](#), [elistWrite](#): utility functions for ddCtExpression objects [ddCtExpression](#): the method which invokes the ddCt algorithm

**Examples**

```
## read a SDM file
sampdat <- SDMFrame(system.file("extdata", "Experiment1.txt",
                               package="ddCt"))

## call ddCtExpression method to get a ddCt calculated expression
result <- ddCtExpression(sampdat,
                        calibrationSample="Sample1",
                        housekeepingGenes=c("Gene1", "Gene2"))

## use getter methods
ddCt(result)
ddCtErr(result)
```

---

ddCtExpression-methods

*Apply the ddCt algorithm for a given data set*

---

**Description**

Apply the ddCt algorithm for a given data set

**Arguments**

object	SDMFrame Data object which holds a data set containing columns with the following names: 'Ct', 'Sample', 'Detector', 'Platename'. The column 'Ct' must contain numeric values.
algorithm	character. Name of the calibration samples.
warningStream	character of length 1. The name of the file the warnings should be stored in.
calibrationSample	character. Name of the calibration samples.
housekeepingGenes	character. Name of the housekeeping genes.
type	character of length 1. 'mean' or 'median'- which method should be used for the aggregation of the replicates
sampleInformation	if specified it must be an object of class phenoData with a column named 'Sample'.
toZero	boolean - if there is only one replication should the error be treated as zero ? (only if 'type' is mean)

```
efficiencies n.V.  
efficiencies.error  
              n.V.
```

**Value**

A an object of class `ddCtExpression`.

**usage**

```
ddCtExpression(object, warningStream = "warning.output.txt", algorithm="ddCt" calibrationSample,  
housekeepingGenes, type="mean", sampleInformation=NULL, toZero=TRUE, efficiencies =  
NULL, efficiencies.error = NULL)
```

**Methods**

**object = "SDMFrame"** An object of `SDMFrame`, constructed with the method `SDMFrame`

**Author(s)**

Rudolf Biczok <mailto:r.biczok@dkfz.de>

**References**

Analysis of relative gene expression data using real-time quantitative PCR and the 2(-Delta -Delta C(T)) Method. KJ Livak and TD Schmittgen, Methods, Vol. 25, No. 4. (December 2001), pp. 402-408

**See Also**

`SDMFrame`: reader for SDM files `ddCtExpression`: representation for ddCt calculated expressions

**Examples**

```
## read a SDM file  
sampdat <- SDMFrame(system.file("extdata", "Experiment1.txt", package="ddCt"))  
  
## call ddCtExpression method from class SDMFrame  
## to get a ddCt calculated expression  
result <- ddCtExpression(sampdat,  
                        calibrationSample="Sample1",  
                        housekeepingGenes=c("Gene1", "Gene2"))  
  
result
```

---

elistWrite-methods *Write ddCtExpression object into data frame or files*

---

## Description

ddCtExpression object contains a list of matrices as the results of `ddCt` method. `elist` combines these lists into one data frame, and `elistWrite` writes the data frame into file.

## Usage

```
elist(object, ...)
elistWrite(object, file, ...)
```

## Arguments

<code>object</code>	an <code>ExpressionSet</code> object.
<code>file</code>	output file.
<code>...</code>	additional arguments passed to <code>write.table</code> .

## Details

`elist` is a wrapper to `as(object, "data.frame")` function.

## Value

A data frame or output file.

## Author(s)

Jitao David Zhang <j.zhang@dkfz.de>

## Examples

```
## read a SDM file
sampdat <- SDMFrame(system.file("extdata", "Experiment1.txt", package="ddCt"))

## call ddCtExpression method from class SDMFrame
## to get a ddCt calculated expression
result <- ddCtExpression(sampdat,
                        calibrationSample="Sample1",
                        housekeepingGenes=c("Gene1", "Gene2"))

## call elist
elistResult <- elist(result)
elistResult
```

---

`errBarchart-methods`*Draw barchart of relative expression level with error-bars*

---

### Description

Draw barchart (with error-bars) of relative expression level represented in `ddCtExpression` object. The barchart is implemented as grid plot by `lattice` package, where each panel represents one sample and the relative expression values of detectors (as well as their standard errors) are depicted as bars.

Detectors which are not determined are marked by grey NA.

### Methods

**object = "ddCtExpression"** An object of `ddCtExpression`, constructed with the method `ddCtExpression`

---

`errBarchartParameter-class`*Class "errBarchartParameter"*

---

### Description

Parameter object for `errBarchart`

### Objects from the Class

Objects can be created by calls of the form `new("errBarchartParameter", ...)`. So far the object is only internally used, but in the near future it will be exported.

### Slots

**exprsUndeterminedLabel:** Object of class "character", specifying the text label when the expression level is 'Undetermined'

### Methods

**exprsUndeterminedLabel** signature(object = "errBarchartParameter"): getting the text label when the expression level is 'Undetermined'

**show** signature(object = "errBarchartParameter"): print method

### Note

So far it is only internally used

### Author(s)

Jitao David Zhang <j.zhang@dkfz.de>

## Examples

```
## Internally used
## param <- new("errBarChartParameter")
## exprsUndeterminedLabel(param)
```

---

```
replaceVectorByEquality
```

*REPLACE ITEMS OF VECTOR BY EQUALITY*

---

## Description

The function replaces (or updates) the items of a given vector by checking the equality with the `target` parameter. If found, the item will be replaced by the `value` parameter. The length of both `target` and `value` must be the same and could be longer than 1, in which case the replace will be iterated.

## Usage

```
replaceVectorByEquality(vector, target, value)
```

## Arguments

<code>vector</code>	A vector to be replaced. The items of the vector must be atom types, since the equality is checked by <code>'=='</code> .
<code>target</code>	targets to be replaced, could be either single or a vector
<code>value</code>	values to be replaced at the positions of targets, must be of the same length of <code>target</code>

## Details

A warning will be prompted if any item in the `target` cannot be found

## Value

A vector of the same length as the parameter `vector`

## Author(s)

Jitao David Zhang

## See Also

`==` for checking equality.

## Examples

```
vector <- c("java", "perl", "python", "c#")
replaceVectorByEquality(vector, target="c#", value="c/c++")
replaceVectorByEquality(vector, target=c("c#", "perl"), value=c("c/c++", "R"))
```

## Description

The class `SDMFrame` provides core functionalities to read gene and sample information from SDM files and calculate them with a `ddCt` algorithm.

The function `SDMFrame` reads the data given in the columns 'Detector', 'Sample' and 'Ct' of the specified SDM output files and stores them as a `data.frame`. An additional column including the respective filename is added.

## Slots

**coreData:** Object of class "data.frame": Holds all the required data extracted from the SDM file

**files:** Object of class "character" contains the source SDM files

## Methods

**[[,]\$** signature(x = "SDMFrame"): primitive accessors. Returns an object of `SDMFrame-class` with the subset data.

**names** signature(x = "SDMFrame"): returns the column names in this SDM object

**ddCtExpression** signature(object = "SDMFrame"): runs a `ddCt` algorithm with this SDM object and returns a object of class `ddCtExpression`

**fileNames** signature(object="SDMFrame"): returns the source SDM file names.

**detectorNames** signature(object = "SDMFrame"): returns the detector names in this SDM object

**detectorNames<-** signature(object = "SDMFrame", value = "character"): replaces the detector names in this SDM object

**sampleNames** signature(object = "SDMFrame"): returns the sample names in this SDM object

**sampleNames<-** signature(object = "SDMFrame", value = "character"): replaces the sample names in this SDM object

**uniqueDetectorNames** signature(object = "SDMFrame"): returns a vector of unique detector names in this SDM object

**uniqueDetectorNames<-** signature(object = "SDMFrame", target = "missing", value = "character"): replaces all detector names given by the 'names' attribute in 'value' with new detector names

**uniqueDetectorNames<-** signature(object = "SDMFrame", target = "character", value = "character"): replaces all detector names given by 'target' with new detector names

**uniqueSampleNames<-** signature(object = "SDMFrame", target = "missing", value = "character"): replaces all sample names given by the 'names' attribute in 'value' with new sample names

**uniqueSampleNames<-** signature(object = "SDMFrame", target = "character", value = "character"): replaces all sample names given by 'target' with new sample names

**uniqueSampleNames** signature(object = "SDMFrame"): returns a vector of unique sample names in this SDM object

**removeSample** signature(object = "SDMFrame", sample="character"): removes the sample(s) specified from the SDMFrame object

**replaceDetector** signature(object = "SDMFrame", target="character", value="character"): replace the detectors equal to the target with the value. Both target and value can be vectors of the same length, then the replace takes place iteratively.

**replaceSample** signature(object = "SDMFrame", target="character", value="character"): replace the samples equal to the target with the value. Both target and value can be vectors of the same length, then the replace takes place iteratively.

**show** signature(object="SDMFrame"): pretty print of the SDMFrame instance.

**rightCensoring** signature(object="SDMFrame", threshold="numeric"): Right censoring the Ct value, which targets the data points above a certain value (threshold). High Ct values (higher than 40 or 45 by the rule of thumb) are often not accurate and may indicate too weak expression. The function performs the right censoring on the data and set the value above the threshold as NA (by default) or a given value. See the example.

**coreData** signature(object="SDMFrame"): returns the data frame read from SDM file.

**coreData<-** signature(object="SDMFrame"): replace the data frame read from SDM file.

**Ct** signature(object="SDMFrame"): returns the Ct value of the SDM file.

Rudolf Biczok <mailto:r.biczok@dkfz.de>, Jitao David Zhang <mailto:j.zhang@dkfz.de>

#### See Also

[SDMFrame](#) function reads in data from SDM files. Data from SDM files is used to construct [ddCtExpression](#) objects to analyze differential expression.

#### Examples

```
## read a SDM file
sampdat <- SDMFrame(system.file("extdata", "Experiment1.txt",
                               package="ddCt"))

## you can also write
## sampdat <- new("SDMFrame",system.file("extdata", "Experiment1.txt",
##                                       package="ddCt"))

## use the getter methods
sampleNames(sampdat)

## or the overloaded primitive accessors
sampdat[1:3, "Sample"]

## see all unique samples
uniqueSampleNames(sampdat)

## replace all sample names 'Sample1' and 'Sample2' in sampdat
## with 'NewSample1' and 'NewSample2'
uniqueSampleNames(sampdat, c("Sample1", "Sample2")) <- c("NewSample1", "NewSample2")
uniqueSampleNames(sampdat)

## or use this syntax to replace the gene names
```

```
uniqueDetectorNames(sampdat) <- c(Gene1="NewGene1", Gene2="NewGene2")
uniqueDetectorNames(sampdat)

## remove sample or detector
removeSample(sampdat, "Sample1")
removeDetector(sampdat, "Gene1")

## replace sample or detector
replaceSample(sampdat, "Sample1", "Sample0")
replaceDetector(sampdat, "Gene1", "PLCG1")

## right censoring the data
rightCensoring(sampdat, 35)
rightCensoring(sampdat, 35, 35)
```

---

SDMFrame

*Read an SDM file*

---

## Description

Read an SDM file: Data Output File for SDS, Version 2.1

## Usage

```
SDMFrame(files)
readSDM(files)
```

## Arguments

`files`            Character vector of filenames

## Details

This function reads the data given in the columns 'Detector', 'Sample' and 'Ct' of the specified SDM output files and stores them as a data.frame. An additional column including the respective filename is added.

This function is a wrapper for the SDMFrame constructor

## Value

A object of class `SDMFrame`

## Author(s)

Rudolf Biczok <mailto:r.biczok@dkfz.de>

**Examples**

```
## read a SDM file
sampdat <- SDMFrame(system.file("extdata", "Experiment1.txt",
                               package="ddCt"))

## you can also write
## sampdat <- new("SDMFrame",system.file("extdata", "Experiment1.txt",
##                                       package="ddCt"))

## or with
## sampdat <- readSDM(system.file("extdata", "Experiment1.txt",
##                                package="ddCt"))

## use the getter methods
sampleNames(sampdat)

## or the overloaded primitive accessors
sampdat[1:3,"Sample"]

## see all unique samples
uniqueSampleNames(sampdat)

## replace all sample names 'Sample1' and 'Sample2' in sampdat
## with 'NewSample1' and 'NewSample2'
uniqueSampleNames(sampdat,c("Sample1","Sample2")) <- c("NewSample1","NewSample2")
uniqueSampleNames(sampdat)

## or use this syntax to replace the gene names
uniqueDetectorNames(sampdat) <- c(Gene1="NewGene1", Gene2="NewGene2")
uniqueDetectorNames(sampdat)
```

---

write.htmltable      *Write a data frame into an html table within a html page*

---

**Description**

Write a 'data.frame' into an html table within a html page

**Usage**

```
write.htmltable(x, filename, title = "", sortby = NULL, decreasing = TRUE, open
```

**Arguments**

x	'data.frame'
filename	character. File name.
title	character. Title of html page
sortby	character. Name of column by which to sort the table rows
decreasing	logical. Should the sort order be increasing or decreasing?
open	character. This argument is passed onto 'file'

**Value**

The function is called for its side effect: writing a file

**Author(s)**

Wolfgang Huber

---

`writeSimpleTabCsv` *Write a data frame into a tab delimited file*

---

**Description**

Write a 'data.frame' into a tab delimited file (not quoted and no-row-name CSV file)

**Usage**

```
writeSimpleTabCsv(x, file, ...)
```

**Arguments**

<code>x</code>	'data.frame'
<code>file</code>	character. File name.
<code>...</code>	Additional arguments passed onto the function

**Value**

The function is called for its side effect: writing a file

**Author(s)**

Wolfgang Huber
