

# xmapbridge

April 19, 2010

---

exon.data

*Sample exon array dataset*

---

## Description

Data frame containing gene,exon and probeset IDs and probeset target locations for a subset of an Affymetrix exon array dataset comparing two cell lines (mcf7 and mcf10a).

## Usage

```
data (xmapbridge)
```

## Details

The object is a subset (80 genes, 1747 probesets) of RMA processed Exon Array data with associated annotation. It was generated using the exonmap bioconductor package. More details on the original dataset can be found in Okniewski MJ, Miller CJ. Comprehensive Analysis of Affymetrix Exon Arrays Using BioConductor. PLoS Computational Biology 2008, 4(2): e6 doi:10.1371/journal.pcbi.0040006.

## Value

On loading, creates the object exon.data.

---

xmapbridge-package *Export plotting files to the xmapBridge for visualisation in X:Map*

---

## Description

The XMapBridge is a Java application which allows you to plot graphs in the X:Map genome browser. This package exports plotting files in a suitable format for the XMapBridge to read.

## Details

Package: xmapbridge  
 Type: Package  
 Version: 1.0  
 Date: 2008-08-11  
 License: LGPL-v3

*xmap.col*

*Generate a colour integer for the xmapBridge*

## **Description**

Convert an R colour into the form 0xAARRGGBB as used by the xmapBridge

**Usage**

```
xmap.col(col, alpha)
```

**Arguments**

col	The R colour to convert
alpha	Change the colour's alpha value to the one specified

**Details**

Takes one or more hex strings, possibly with an alpha value, as used by R and converts them to an integer of the form 0xAARRGGBB to be used by the xmapBridge. If alpha is specified, then change the colours' alpha values to this, otherwise leave them as they were.

**Examples**

```
require( RColorBrewer )
transparent.greens <- xmap.col( brewer.pal( 5, "Greens" ), alpha=0x22 )
```

---

xmap.files

*Underlying xmap methods for manipulating projects, graphs, and plots*

---

**Description**

These methods are used to control xmap.projects, xmap.graphs and xmap.plots

A project contains one or more graphs, and a graph can contain one or more plots (each plot can have a different style)

A simpler method to generate X:Map graphs is to use the xmap.plot and xmap.points methods.

The xmap.debug method was introduced as otherwise the vignette would not print out id values as it was supposed to. For some reason Sweave ignores the show and as.character methods being overridden, and simply does its own thing.

## Usage

```

xmap.debug( idobject, newlines=FALSE )

xmap.project.new( name )
xmap.project.list()
xmap.project.load( projectid )
xmap.project.save( projectid, data )
xmap.project.delete( projectid )

xmap.graph.new( projectid, name, desc, min, max, chr, start, stop, ylab="value"
                species=c("homo_sapiens", "mus_musculus", "rattus_norvegicus") )
xmap.graph.list( projectid )
xmap.graph.load( graphid )
xmap.graph.save( graphid, data )
xmap.graph.delete( graphid )

xmap.plot.new( graphid, name, x, y,
                type=c("scatter", "line", "bar", "step", "area", "stepparea"),
                col = NULL, dp = 2 )
xmap.plot.list( graphid )
xmap.plot.load( plotid )
xmap.plot.save( plotid, data, x, y, dp = 2 )
xmap.plot.delete( plotid )

```

## Arguments

<code>idobject</code>	An id object for an xmapbridge project, graph or plot
<code>newlines</code>	Should the resultant string be nicely formatyted with newline characters?
<code>name</code>	The name for this object (stored in the NAME variable of the list returned by <code>load</code> )
<code>projectid</code>	The projectid (returned by <code>xmap.project.new</code> and as a list from <code>xmap.project.list</code> )
<code>data</code>	This is a list object for this particular object type
<code>desc</code>	The description for this item
<code>min</code>	The minimum y value for the graph
<code>max</code>	The maximum y value for the graph
<code>chr</code>	A string representing the chromosome this graph is to be drawn on
<code>start</code>	The BP that this graph should start on
<code>stop</code>	The BP that this graph reaches until. Must be greater than start
<code>ylab</code>	The label for the yaxis of this graph
<code>species</code>	The species that this graph is to be drawn on
<code>graphid</code>	The graphid returned by <code>xmap.graph.new</code> or <code>xmap.graph.list</code>
<code>type</code>	The type of graph you wish to draw
<code>col</code>	The colour of the graph defined as an integer in the format 0xAARRGGBB. See <a href="#">xmap.col</a>
<code>x</code>	The points for the x-axis of this plot. These points must be offsets from the start of the graph, and not their actual chromosomal location

y	The points for the y-axis of this plot. Points where min>y or y >max will not be displayed
dp	The number of decimal places you want to save for the y-coordinates
plotid	The plotid which is returned by xmap.plot.new or xmap.plot.list

**Value**

xmap.graph.new returns the graphid of the created graph xmap.graph.list returns a vector of all graphs contained within the given project xmap.graph.load returns a list containing the parameters for the given graph xmap.graph.save

**Author(s)**

Tim Yates

**See Also**

[xmap.plot](#)  
[xmap.points](#)  
[xmap.col](#)  
<http://xmap.picr.man.ac.uk>

**Examples**

```
# Create a new project
projectid <- xmap.project.new( "A quick project" )

# Create a graph in this project covering 100K bases on chromosome 1
graphid <- xmap.graph.new( projectid, "A quick graph", "This is a quick graph",
                           -10, 10, "1", 5000, 105000, species="homo_sapiens" )

# Make our datasets
x <- seq( 1000, 100000, by = 1000 )
y <- runif( length( x ), -10, 10 )

# Then add a plot to this graph
xmap.plot.new( graphid, "Graph 1", x, y, type="area", col=0xAFFEE00 )

# And another one, in a different colour
a <- xmap.plot.new( graphid, "Graph 2", x, y, type="scatter", col=0xAA0000FF )

cat( xmap.debug( a, newlines=TRUE ) )

# At this point, we should be able to see the graphs using the XMapBridge application

# Clean up our project file...
xmap.project.delete( projectid )
```

*xmap.plot**Utility methods for quick graph generation*

## Description

These methods attempt to provide a simpler interface for generating X:Map graphs.

## Usage

```
xmap.plot( x, y, species=c("homo_sapiens", "mus_musculus", "rattus_norvegicus"),
            chr, xlim, ylim, main, sub,
            type=c("scatter", "line", "bar", "step", "area", "steparea"),
            xlab, ylab = "value", col, dp=2, projectid )
xmap.points( x, y, type=c("scatter", "line", "bar", "step", "area", "steparea"),
              xlab, col, dp=2, graphid )
```

## Arguments

<code>x</code>	The points for the x-axis of this plot. These points must be offsets from the start of the graph, and not their actual chromosomal location
<code>y</code>	The points for the y-axis of this plot. Points where <code>min&gt;y</code> or <code>y &gt;max</code> will not be displayed
<code>species</code>	The species that this graph is to be drawn on
<code>chr</code>	A string representing the chromosome this graph is to be drawn on
<code>xlim</code>	A range object describing the min and max BP for this graph. If ommitted, we call range on the <code>x</code> parameter
<code>ylim</code>	The maximum and minimum Y value for the graph. If ommitted, we call range on the <code>y</code> parameter
<code>main</code>	The main title
<code>sub</code>	A sub-title for this graph
<code>type</code>	The type of graph you wish to draw
<code>xlab</code>	The label for this plot
<code>ylab</code>	The label for the yaxis of this graph
<code>col</code>	The colour of the graph defined as an integer in the format 0xAARRGGBB. See <a href="#">xmap.col</a>
<code>dp</code>	The number of decimal places you want to save for the y-coordinates
<code>projectid</code>	The projectid (returned by <a href="#">xmap.project.new</a> and as a list from <a href="#">xmap.project.list</a> . If this is not passed, on the first time of calling a new project will be created, and will be used on all subsequent calls)
<code>graphid</code>	The graphid returned by <a href="#">xmap.graph.new</a> or <a href="#">xmap.graph.list</a> . If this is not passed, it will use the last graph generated by <a href="#">xmap.plot</a> .
