Computations related to the Bioinformatics Applications Note, 2009

VJ Carey stvjc at channing.harvard.edu

October 28, 2009

The main illustrations in the Applications note involve a gene set. All chunks have eval=FALSE; to run this code, please manually reset.

```
> library(GGtools)
> data(hla2set)
```

> hla2set

We need to filter the full HapMap CEU cohort to founders:

```
> library(GGdata)
```

```
> data(hmceuB36)
```

```
> hmFou = hmceuB36[, which(hmceuB36$isFounder == TRUE)]
```

Now we run the tests:

> hla2run = gwSnpTests(hla2set ~ male, hmFou, snpdepth(250))
