

# Package ‘CoGAPS’

October 14, 2021

**Version** 3.12.0

**Date** 2020-12-30

**Title** Coordinated Gene Activity in Pattern Sets

**Author** Thomas Sherman, Wai-shing Lee, Conor Kelton, Ondrej Maxian, Jacob Carey, Genevieve Stein-O’Brien, Michael Considine, Maggie Wodicka, John Stansfield, Shawn Sivy, Carlo Colantuoni, Alexander Favorov, Mike Ochs, Elana Fertig

**Description** Coordinated Gene Activity in Pattern Sets (CoGAPS) implements a Bayesian MCMC matrix factorization algorithm, GAPS, and links it to gene set statistic methods to infer biological process activity. It can be used to perform sparse matrix factorization on any data, and when this data represents biomolecules, to do gene set analysis.

**Maintainer** Elana J. Fertig <ejfertig@jhmi.edu>, Thomas D. Sherman <tomsherman159@gmail.com>, Melanie L. Loth <mloth1@jhmi.edu>

**Depends** R (>= 3.5.0)

**Imports** BiocParallel, cluster, methods, gplots, graphics, grDevices, RColorBrewer, Rcpp, S4Vectors, SingleCellExperiment, stats, SummarizedExperiment, tools, utils, rhdf5

**Suggests** testthat, knitr, rmarkdown, BiocStyle

**LinkingTo** Rcpp, BH

**VignetteBuilder** knitr

**LazyLoad** true

**License** BSD\_3\_clause + file LICENSE

**biocViews** GeneExpression, Transcription, GeneSetEnrichment, DifferentialExpression, Bayesian, Clustering, TimeCourse, RNASeq, Microarray, MultipleComparison, DimensionReduction, ImmunoOncology

**NeedsCompilation** yes

CoGAPS-package

*CoGAPS: Coordinated Gene Activity in Pattern Sets*

---

## Description

CoGAPS implements a Bayesian MCMC matrix factorization algorithm, GAPS, and links it to gene set statistic methods to infer biological process activity. It can be used to perform sparse matrix factorization on any data, and when this data represents biomolecules, to do gene set analysis.

Package: CoGAPS  
Type: Package  
Version: 2.99.0  
Date: 2018-01-24  
License: LGPL

## Author(s)

Maintainer: Elana J. Fertig <ejfertig@jhmi.edu>, Michael F. Ochs <ochsm@tcnj.edu>

## References

Fertig EJ, Ding J, Favorov AV, Parmigiani G, Ochs MF. CoGAPS: an R/C++ package to identify patterns and biological process activity in transcriptomic data. Bioinformatics. 2010 Nov 1;26(21):2792-3

---

*binaryA*

*binary heatmap for standardized feature matrix*

---

## Description

creates a binarized heatmap of the A matrix in which the value is 1 if the value in Amean is greater than threshold \* Asd and 0 otherwise

**Usage**

```
binaryA(object, threshold = 3)

## S4 method for signature 'CogapsResult'
binaryA(object, threshold = 3)
```

**Arguments**

- object** an object of type CogapsResult  
**threshold** the number of standard deviations above zero that an element of Amean must be to get a value of 1

**Value**

plots a heatmap of the A Matrix

**Examples**

```
data(GIST)
# to expensive to call since it plots
# binaryA(GIST.result, threshold=3)
```

<b>buildReport</b>	<i>Information About Package Compilation</i>
--------------------	--

**Description**

Information About Package Compilation

**Usage**

```
buildReport()
```

**Details**

returns information about how the package was compiled, i.e. which compiler/version was used, which compile time options were enabled, etc...

**Value**

string containing build report

**Examples**

```
CoGAPS::buildReport()
```

---

calcCoGAPSStat      *calculate statistic on sets of measurements (genes) or samples*

---

## Description

calculates a statistic to determine if a pattern is enriched in a particular set of measurements or samples.

## Usage

```
calcCoGAPSStat(  
  object,  
  sets = NULL,  
  whichMatrix = "featureLoadings",  
  numPerm = 1000,  
  ...  
)  
  
## S4 method for signature 'CogapsResult'  
calcCoGAPSStat(  
  object,  
  sets = NULL,  
  whichMatrix = "featureLoadings",  
  numPerm = 1000,  
  ...  
)
```

## Arguments

object	an object of type CogapsResult
sets	list of sets of measurements/samples
whichMatrix	either "featureLoadings" or "sampleFactors" indicating which matrix to calculate the statistics for
numPerm	number of permutations to use when calculating p-value
...	handles old arguments for backwards compatibility

## Value

gene set statistics for each column of A

---

<code>calcGeneGSStat</code>	<i>probability gene belongs in gene set</i>
-----------------------------	---

---

## Description

calculates the probability that a gene listed in a gene set behaves like other genes in the set within the given data set

## Usage

```
calcGeneGSStat(
  object,
  GStoGenes,
  numPerm,
  Pw = rep(1, ncol(object@featureLoadings)),
  nullGenes = FALSE
)

## S4 method for signature 'CogapsResult'
calcGeneGSStat(
  object,
  GStoGenes,
  numPerm,
  Pw = rep(1, ncol(object@featureLoadings)),
  nullGenes = FALSE
)
```

## Arguments

<code>object</code>	an object of type CogapsResult
<code>GStoGenes</code>	data.frame or list with gene sets
<code>numPerm</code>	number of permutations for null
<code>Pw</code>	weight on genes
<code>nullGenes</code>	logical indicating gene adjustment

## Value

gene similiarity statistic

---

calcZ	<i>compute z-score matrix</i>
-------	-------------------------------

---

### Description

calculates the Z-score for each element based on input mean and standard deviation matrices

### Usage

```
calcZ(object, whichMatrix)

## S4 method for signature 'CogapsResult'
calcZ(object, whichMatrix)
```

### Arguments

object	an object of type CogapsResult
whichMatrix	either "featureLoadings" or "sampleFactors" indicating which matrix to calculate the z-score for

### Value

matrix of z-scores

### Examples

```
data(GIST)
featureZScore <- calcZ(GIST.result, "featureLoadings")
```

---

checkpointsEnabled	<i>Check if package was built with checkpoints enabled</i>
--------------------	--

---

### Description

Check if package was built with checkpoints enabled

### Usage

```
checkpointsEnabled()
```

### Value

true/false if checkpoints are enabled

### Examples

```
CoGAPS::checkpointsEnabled()
```

## Description

calls the C++ MCMC code and performs Bayesian matrix factorization returning the two matrices that reconstruct the data matrix

## Usage

```
CoGAPS(
  data,
  params = new("CogapsParams"),
  nThreads = 1,
  messages = TRUE,
  outputFrequency = 1000,
  uncertainty = NULL,
  checkpointOutFile = "gaps_checkpoint.out",
  checkpointInterval = 0,
  checkpointInFile = NULL,
  transposeData = FALSE,
  BPPARAM = NULL,
  workerID = 1,
  asynchronousUpdates = TRUE,
  nSnapshots = 0,
  snapshotPhase = "sampling",
  ...
)
```

## Arguments

<code>data</code>	File name or R object (see details for supported types)
<code>params</code>	CogapsParams object
<code>nThreads</code>	maximum number of threads to run on
<code>messages</code>	T/F for displaying output
<code>outputFrequency</code>	number of iterations between each output (set to 0 to disable status updates, other output is controlled by @code messages)
<code>uncertainty</code>	uncertainty matrix - either a matrix or a supported file type
<code>checkpointOutFile</code>	name of the checkpoint file to create
<code>checkpointInterval</code>	number of iterations between each checkpoint (set to 0 to disable checkpoints)
<code>checkpointInFile</code>	if this is provided, CoGAPS runs from the checkpoint contained in this file

transposeData	T/F for transposing data while reading it in - useful for data that is stored as samples x genes since CoGAPS requires data to be genes x samples
BPPARAM	BiocParallel backend
workerID	if calling CoGAPS in parallel the worker ID can be specified, only worker 1 prints output and each worker outputs when it finishes, this is not necessary when using the default parallel methods (i.e. distributed CoGAPS) but only when the user is manually calling CoGAPS in parallel
asynchronousUpdates	enable asynchronous updating which allows for multi-threaded runs
nS snapshots	how many snapshots to take in each phase, setting this to 0 disables snapshots
snapshotPhase	which phase to take snapshots in e.g. "equilibration", "sampling", "all"
...	allows for overwriting parameters in params

## Details

The supported R types are: matrix, data.frame, SummarizedExperiment, SingleCellExperiment. The supported file types are csv, tsv, and mtx.

## Value

CogapsResult object

## Examples

```
# Running from R object
data(GIST)
resultA <- CoGAPS(GIST.data_frame, nIterations=25)

# Running from file name
gist_path <- system.file("extdata/GIST.mtx", package="CoGAPS")
resultB <- CoGAPS(gist_path, nIterations=25)

# Setting Parameters
params <- new("CogapsParams")
params <- setParam(params, "nPatterns", 3)
resultC <- CoGAPS(GIST.data_frame, params, nIterations=25)
```

CogapsParams

*CogapsParams constructor*

## Description

create a CogapsParams object

## Usage

CogapsParams(...)

**Arguments**

... parameters for the initialization method

**Value**

*CogapsParams* object

**Examples**

```
params <- CogapsParams(nPatterns=10)
params
```

*CogapsParams-class*      *CogapsParams*

**Description**

Encapsulates all parameters for the CoGAPS algorithm

**Slots**

**nPatterns** number of patterns CoGAPS will learn  
**nIterations** number of iterations for each phase of the algorithm  
**alphaA** sparsity parameter for feature matrix  
**alphaP** sparsity parameter for sample matrix  
**maxGibbsMassA** atomic mass restriction for feature matrix  
**maxGibbsMassP** atomic mass restriction for sample matrix  
**seed** random number generator seed  
**sparseOptimization** speeds up performance with sparse data (roughly >80 default uncertainty  
**distributed** either "genome-wide" or "single-cell" indicating which distributed algorithm should  
be used  
**nSets** [distributed parameter] number of sets to break data into  
**cut** [distributed parameter] number of branches at which to cut dendrogram used in pattern match-  
ing  
**minNS** [distributed parameter] minimum of individual set contributions a cluster must contain  
**maxNS** [distributed parameter] maximum of individual set contributions a cluster can contain  
**explicitSets** [distributed parameter] specify subsets by index or name  
**samplingAnnotation** [distributed parameter] specify categories along the rows (cols) to use for  
weighted sampling  
**samplingWeight** [distributed parameter] weights associated with samplingAnnotation  
**subsetIndices** set of indices to use from the data  
**subsetDim** which dimension (1=rows, 2=cols) to subset

---

`geneNames` vector of names of genes in data  
`sampleNames` vector of names of samples in data  
`fixedPatterns` fix either 'A' or 'P' matrix to these values, in the context of distributed CoGAPS (GWCoGAPS/scCoGAPS), the first phase is skipped and `fixedPatterns` is used for all sets - allowing manual pattern matching, as well as fixed runs of standard CoGAPS  
`whichMatrixFixed` either 'A' or 'P', indicating which matrix is fixed  
`takePumpSamples` whether or not to take PUMP samples

---

CogapsResult-class      *CogapsResult*

---

### Description

Contains all output from Cogaps run

### Slots

`factorStdDev` std dev of the sampled P matrices  
`loadingStdDev` std dev of the sampled A matrices

---

`compiledWithOpenMPsupport`

*Check if compiler supported OpenMP*

---

### Description

Check if compiler supported OpenMP

### Usage

`compiledWithOpenMPsupport()`

### Value

true/false if OpenMP was supported

### Examples

`CoGAPS::compiledWithOpenMPsupport()`

---

<code>computeGeneGSProb</code>	<i>compute gene probability</i>
--------------------------------	---------------------------------

---

## Description

Computes the p-value for gene set membership using the CoGAPS-based statistics developed in Fertig et al. (2012). This statistic refines set membership for each candidate gene in a set specified in GSGenes by comparing the inferred activity of that gene to the average activity of the set.

## Usage

```
computeGeneGSProb(
  object,
  GStoGenes,
  numPerm = 500,
  Pw = rep(1, ncol(object@featureLoadings)),
  PwNull = FALSE
)

## S4 method for signature 'CogapsResult'
computeGeneGSProb(
  object,
  GStoGenes,
  numPerm = 500,
  Pw = rep(1, ncol(object@featureLoadings)),
  PwNull = FALSE
)
```

## Arguments

<code>object</code>	an object of type CogapsResult
<code>GStoGenes</code>	data.frame or list with gene sets
<code>numPerm</code>	number of permutations for null
<code>Pw</code>	weight on genes
<code>PwNull</code>	- logical indicating gene adjustment

## Value

A vector of length GSGenes containing the p-values of set membership for each gene contained in the set specified in GSGenes.

---

findConsensusMatrix    *find the consensus pattern matrix across all subsets*

---

**Description**

find the consensus pattern matrix across all subsets

**Usage**

```
findConsensusMatrix(unmatchedPatterns, gapsParams)
```

**Arguments**

unmatchedPatterns	list of all unmatched pattern matrices from initial run of CoGAPS
gapsParams	list of all CoGAPS parameters

**Value**

matrix of consensus patterns

---

getAmplitudeMatrix    *return Amplitude matrix from CogapsResult object*

---

**Description**

return Amplitude matrix from CogapsResult object

**Usage**

```
getAmplitudeMatrix(object)

## S4 method for signature 'CogapsResult'
getAmplitudeMatrix(object)
```

**Arguments**

object	an object of type CogapsResult
--------	--------------------------------

**Value**

amplitude matrix

**Examples**

```
data(GIST)
amplitudeMatrix <- getAmplitudeMatrix(GIST.result)
```

---

getClusteredPatterns *return clustered patterns from set of all patterns across all subsets*

---

**Description**

return clustered patterns from set of all patterns across all subsets

**Usage**

```
getClusteredPatterns(object)

## S4 method for signature 'CogapsResult'
getClusteredPatterns(object)
```

**Arguments**

object            an object of type CogapsResult

**Value**

CogapsParams object

**Examples**

```
data(GIST)
clusteredPatterns <- getClusteredPatterns(GIST.result)
```

---

getCorrelationToMeanPattern

*return correlation between each pattern and the cluster mean*

---

**Description**

return correlation between each pattern and the cluster mean

**Usage**

```
getCorrelationToMeanPattern(object)

## S4 method for signature 'CogapsResult'
getCorrelationToMeanPattern(object)
```

**Arguments**

object            an object of type CogapsResult

**Value**

CogapsParams object

**Examples**

```
data(GIST)
corrToMeanPattern <- getCorrelationToMeanPattern(GIST.result)
```

---

getFeatureLoadings      *return featureLoadings matrix from CogapsResult object*

---

**Description**

return featureLoadings matrix from CogapsResult object

**Usage**

```
getFeatureLoadings(object)

## S4 method for signature 'CogapsResult'
getFeatureLoadings(object)
```

**Arguments**

object      an object of type CogapsResult

**Value**

featureLoadings matrix

**Examples**

```
data(GIST)
fLoadings <- getFeatureLoadings(GIST.result)
```

getMeanChiSq	<i>return chi-sq of final matrices</i>
--------------	--

**Description**

return chi-sq of final matrices

**Usage**

```
getMeanChiSq(object)

## S4 method for signature 'CogapsResult'
getMeanChiSq(object)
```

**Arguments**

object            an object of type CogapsResult

**Value**

chi-sq error

**Examples**

```
data(GIST)
getMeanChiSq(GIST.result)
```

getOriginalParameters	<i>return original parameters used to generate this result</i>
-----------------------	--

**Description**

return original parameters used to generate this result

**Usage**

```
getOriginalParameters(object)

## S4 method for signature 'CogapsResult'
getOriginalParameters(object)
```

**Arguments**

object            an object of type CogapsResult

**Value**

CogapsParams object

**Examples**

```
data(GIST)
params <- getOriginalParameters(GIST.result)
```

---

getParam	<i>get the value of a parameter</i>
----------	-------------------------------------

---

**Description**

get the value of a parameter

**Usage**

```
getParam(object, whichParam)

## S4 method for signature 'CogapsParams'
getParam(object, whichParam)
```

**Arguments**

object	an object of type CogapsParams
whichParam	a string with the name of the requested parameter

**Value**

the value of the parameter

**Examples**

```
params <- new("CogapsParams")
getParam(params, "seed")
```

`getPatternMatrix`      *return pattern matrix from CogapsResult object*

### Description

return pattern matrix from CogapsResult object

### Usage

```
getPatternMatrix(object)

## S4 method for signature 'CogapsResult'
getPatternMatrix(object)
```

### Arguments

`object`      an object of type CogapsResult

### Value

pattern matrix

### Examples

```
data(GIST)
patternMatrix <- getPatternMatrix(GIST.result)
```

`getRetinaSubset`      *get specified number of retina subsets*

### Description

combines retina subsets from extdata directory

### Usage

```
getRetinaSubset(n = 1)
```

### Arguments

`n`      number of subsets to use

### Value

matrix of RNA counts

**Examples**

```
retSubset <- getRetinaSubset()  
dim(retSubset)
```

---

getSampleFactors	<i>return sampleFactors matrix from CogapsResult object</i>
------------------	---

---

**Description**

return sampleFactors matrix from CogapsResult object

**Usage**

```
getSampleFactors(object)  
  
## S4 method for signature 'CogapsResult'  
getSampleFactors(object)
```

**Arguments**

object            an object of type CogapsResult

**Value**

sampleFactors matrix

**Examples**

```
data(GIST)  
sFactors <- getSampleFactors(GIST.result)
```

---

getSubsets	<i>return the names of the genes (samples) in each subset</i>
------------	---

---

**Description**

return the names of the genes (samples) in each subset

**Usage**

```
getSubsets(object)  
  
## S4 method for signature 'CogapsResult'  
getSubsets(object)
```

**Arguments**

**object** an object of type CogapsResult

**Value**

CogapsParams object

**Examples**

```
data(GIST)
subsets <- getSubsets(GIST.result)
```

**getUnmatchedPatterns** *return unmatched patterns from each subset*

**Description**

return unmatched patterns from each subset

**Usage**

```
getUnmatchedPatterns(object)

## S4 method for signature 'CogapsResult'
getUnmatchedPatterns(object)
```

**Arguments**

**object** an object of type CogapsResult

**Value**

CogapsParams object

**Examples**

```
data(GIST)
unmatchedPatterns <- getUnmatchedPatterns(GIST.result)
```

---

getVersion	<i>return version number used to generate this result</i>
------------	---

---

**Description**

return version number used to generate this result

**Usage**

```
getVersion(object)

## S4 method for signature 'CogapsResult'
getVersion(object)
```

**Arguments**

object           an object of type CogapsResult

**Value**

version number

**Examples**

```
data(GIST)
getVersion(GIST.result)
```

---

GIST.data_frame	<i>GIST gene expression data from Ochs et al. (2009)</i>
-----------------	--

---

**Description**

GIST gene expression data from Ochs et al. (2009)

---

GIST.matrix	<i>GIST gene expression data from Ochs et al. (2009)</i>
-------------	--

---

**Description**

GIST gene expression data from Ochs et al. (2009)

---

**GIST.result***CoGAPS result from running on GIST dataset*

---

**Description**

CoGAPS result from running on GIST dataset

---

**GIST.uncertainty***GIST gene expression uncertainty matrix from Ochs et al. (2009)*

---

**Description**

GIST gene expression uncertainty matrix from Ochs et al. (2009)

---

**GWCoGAPS***Genome Wide CoGAPS*

---

**Description**

wrapper around genome-wide distributed algorithm for CoGAPS

**Usage**

```
GWCoGAPS(
  data,
  params = new("CogapsParams"),
  nThreads = 1,
  messages = TRUE,
  outputFrequency = 500,
  uncertainty = NULL,
  checkpointOutFile = "gaps_checkpoint.out",
  checkpointInterval = 1000,
  checkpointInFile = NULL,
  transposeData = FALSE,
  BPPARAM = NULL,
  workerID = 1,
  asynchronousUpdates = FALSE,
  ...
)
```

### Arguments

data	File name or R object (see details for supported types)
params	CogapsParams object
nThreads	maximum number of threads to run on
messages	T/F for displaying output
outputFrequency	number of iterations between each output (set to 0 to disable status updates, other output is controlled by @code messages)
uncertainty	uncertainty matrix - either a matrix or a supported file type
checkpointOutFile	name of the checkpoint file to create
checkpointInterval	number of iterations between each checkpoint (set to 0 to disable checkpoints)
checkpointInFile	if this is provided, CoGAPS runs from the checkpoint contained in this file
transposeData	T/F for transposing data while reading it in - useful for data that is stored as samples x genes since CoGAPS requires data to be genes x samples
BPPARAM	BiocParallel backend
workerID	if calling CoGAPS in parallel the worker ID can be specified, only worker 1 prints output and each worker outputs when it finishes, this is not necessary when using the default parallel methods (i.e. distributed CoGAPS) but only when the user is manually calling CoGAPS in parallel
asynchronousUpdates	enable asynchronous updating which allows for multi-threaded runs
...	allows for overwriting parameters in params

### Value

CogapsResult object

### Examples

```
## Not run:
data(GIST)
params <- new("CogapsParams")
params <- setDistributedParams(params, nSets=2)
params <- setParam(params, "nIterations", 100)
params <- setParam(params, "nPatters", 3)
result <- GWCoGAPS(GIST.matrix, params, BPPARAM=BiocParallel::SerialParam())

## End(Not run)
```

**initialize,CogapsParams-method**  
*constructor for CogapsParams*

### Description

constructor for CogapsParams

### Usage

```
## S4 method for signature 'CogapsParams'
initialize(.Object, distributed = NULL, ...)
```

### Arguments

.Object	CogapsParams object
distributed	either "genome-wide" or "single-cell" indicating which distributed algorithm should be used
...	initial values for slots

### Value

initialized CogapsParams object

**initialize,CogapsResult-method**  
*Constructor for CogapsResult*

### Description

Constructor for CogapsResult

### Usage

```
## S4 method for signature 'CogapsResult'
initialize(
  .Object,
  Amean,
  Pmean,
  Asd,
  Psd,
  meanChiSq,
  geneNames,
  sampleNames,
  diagnostics = NULL,
  ...
)
```

**Arguments**

.Object	CogapsResult object
Amean	mean of sampled A matrices
Pmean	mean of sampled P matrices
Asd	std dev of sampled A matrices
Psd	std dev of sampled P matrices
meanChiSq	mean value of ChiSq statistic
geneNames	names of genes in data
sampleNames	names of samples in data
diagnostics	assorted diagnostic reports from the run
...	initial values for slots

**Value**

initialized CogapsResult object

patternMarkers      *compute pattern markers statistic*

**Description**

calculate the most associated pattern for each gene

**Usage**

```
patternMarkers(object, threshold = "all", lp = NA, axis = 1)

## S4 method for signature 'CogapsResult'
patternMarkers(object, threshold = "all", lp = NA, axis = 1)
```

**Arguments**

object	an object of type CogapsResult
threshold	the type of threshold to be used. The default "all" will distribute genes into pattern with the lowest ranking. The "cut" thresholds by the first gene to have a lower ranking, i.e. better fit to, a pattern.
lp	a vector of weights for each pattern to be used for finding markers. If NA markers for each pattern of the A matrix will be used.
axis	either 1 or 2, specifying if pattern markers should be calculated using the rows of the data (1) or the columns of the data (2)

**Value**

By default a non-overlapping list of genes associated with each lp.

## Examples

```
data(GIST)
pm <- patternMarkers(GIST.result)
```

**plotPatternMarkers**      *heatmap of original data clustered by pattern markers statistic*

## Description

heatmap of original data clustered by pattern markers statistic

## Usage

```
plotPatternMarkers(
  object,
  data,
  patternPalette,
  sampleNames,
  samplePalette = NULL,
  heatmapCol = bluered,
  colDenogram = TRUE,
  scale = "row",
  ...
)
```

## Arguments

<code>object</code>	an object of type CogapsResult
<code>data</code>	the original data as a matrix
<code>patternPalette</code>	a vector indicating what color should be used for each pattern
<code>sampleNames</code>	names of the samples to use for labeling
<code>samplePalette</code>	a vector indicating what color should be used for each sample
<code>heatmapCol</code>	pallelet giving color scheme for heatmap
<code>colDenogram</code>	logical indicating whether to display sample denogram
<code>scale</code>	character indicating if the values should be centered and scaled in either the row direction or the column direction, or none. The default is "row".
<code>...</code>	additional graphical parameters to be passed to heatmap.2

## Value

heatmap of the data values for the patternMarkers

## See Also

[heatmap.2](#)

---

plotResiduals      *plot of residuals*

---

### Description

calculate residuals and produce heatmap

### Usage

```
plotResiduals(object, data, uncertainty = NULL)

## S4 method for signature 'CogapsResult'
plotResiduals(object, data, uncertainty = NULL)
```

### Arguments

object	an object of type CogapsResult
data	original data matrix run through GAPS
uncertainty	original standard deviation matrix run through GAPS

### Value

creates a residual plot

### Examples

```
data(GIST)
# to expensive to call since it plots
# plotResiduals(GIST.result, GIST.matrix)
```

---

---

reconstructGene      *reconstruct gene*

---

### Description

reconstruct gene

### Usage

```
reconstructGene(object, genes = NULL)

## S4 method for signature 'CogapsResult'
reconstructGene(object, genes = NULL)
```

**Arguments**

object	an object of type CogapsResult
genes	an index of the gene or genes of interest

**Value**

the D' estimate of a gene or set of genes

**Examples**

```
data(GIST)
estimatedD <- reconstructGene(GIST.result)
```

scCoGAPS

*Single Cell CoGAPS*

**Description**

wrapper around single-cell distributed algorithm for CoGAPS

**Usage**

```
scCoGAPS(
  data,
  params = new("CogapsParams"),
  nThreads = 1,
  messages = TRUE,
  outputFrequency = 500,
  uncertainty = NULL,
  checkpointOutFile = "gaps_checkpoint.out",
  checkpointInterval = 1000,
  checkpointInFile = NULL,
  transposeData = FALSE,
  BPPARAM = NULL,
  workerID = 1,
  asynchronousUpdates = FALSE,
  ...
)
```

**Arguments**

data	File name or R object (see details for supported types)
params	CogapsParams object
nThreads	maximum number of threads to run on
messages	T/F for displaying output

```

outputFrequency
    number of iterations between each output (set to 0 to disable status updates,
    other output is controlled by @code messages)

uncertainty      uncertainty matrix - either a matrix or a supported file type
checkpointOutFile
    name of the checkpoint file to create
checkpointInterval
    number of iterations between each checkpoint (set to 0 to disable checkpoints)
checkpointInFile
    if this is provided, CoGAPS runs from the checkpoint contained in this file
transposeData    T/F for transposing data while reading it in - useful for data that is stored as
                    samples x genes since CoGAPS requires data to be genes x samples
BPPARAM          BiocParallel backend
workerID         if calling CoGAPS in parallel the worker ID can be specified, only worker 1
                    prints output and each worker outputs when it finishes, this is not necessary
                    when using the default parallel methods (i.e. distributed CoGAPS) but only
                    when the user is manually calling CoGAPS in parallel
asynchronousUpdates
    enable asynchronous updating which allows for multi-threaded runs
...
    allows for overwriting parameters in params

```

### Value

CogapsResult object

### Examples

```

## Not run:
data(GIST)
params <- new("CogapsParams")
params <- setDistributedParams(params, nSets=2)
params <- setParam(params, "nIterations", 100)
params <- setParam(params, "nPatters", 3)
result <- scCoGAPS(t(GIST.matrix), params, BPPARAM=BiocParallel::SerialParam())

## End(Not run)

```

**setAnnotationWeights** *set the annotation labels and weights for subsetting the data*

### Description

these parameters are interrelated so they must be set together

**Usage**

```
setAnnotationWeights(object, annotation, weights)

## S4 method for signature 'CogapsParams'
setAnnotationWeights(object, annotation, weights)
```

**Arguments**

object	an object of type CogapsParams
annotation	vector of labels
weights	vector of weights

**Value**

the modified params object

**Examples**

```
params <- new("CogapsParams")
params <- setAnnotationWeights(params, c('a', 'b', 'c'), c(1,2,1))
```

**setDistributedParams** *set the value of parameters for distributed CoGAPS*

**Description**

these parameters are interrelated so they must be set together

**Usage**

```
setDistributedParams(
  object,
  nSets = NULL,
  cut = NULL,
  minNS = NULL,
  maxNS = NULL
)

## S4 method for signature 'CogapsParams'
setDistributedParams(
  object,
  nSets = NULL,
  cut = NULL,
  minNS = NULL,
  maxNS = NULL
)
```

**Arguments**

object	an object of type CogapsParams
nSets	number of sets to break data into
cut	number of branches at which to cut dendrogram used in pattern matching
minNS	minimum of individual set contributions a cluster must contain
maxNS	maximum of individual set contributions a cluster can contain

**Value**

the modified params object

**Examples**

```
params <- new("CogapsParams")
params <- setDistributedParams(params, 5)
```

**setFixedPatterns**      *set the fixed patterns for either the A or the P matrix*

**Description**

these parameters are interrelated so they must be set together

**Usage**

```
setFixedPatterns(object, fixedPatterns, whichMatrixFixed)

## S4 method for signature 'CogapsParams'
setFixedPatterns(object, fixedPatterns, whichMatrixFixed)
```

**Arguments**

object	an object of type CogapsParams
fixedPatterns	values for either the A or P matrix
whichMatrixFixed	either 'A' or 'P' indicating which matrix is fixed

**Value**

the modified params object

**Examples**

```
params <- new("CogapsParams")
data(GIST)
params <- setFixedPatterns(params, getSampleFactors(GIST.result), 'P')
```

---

setParam	<i>set the value of a parameter</i>
----------	-------------------------------------

---

### Description

set the value of a parameter

### Usage

```
setParam(object, whichParam, value)

## S4 method for signature 'CogapsParams'
setParam(object, whichParam, value)
```

### Arguments

object	an object of type CogapsParams
whichParam	a string with the name of the parameter to be changed
value	the value to set the parameter to

### Value

the modified params object

### Examples

```
params <- new("CogapsParams")
params <- setParam(params, "seed", 123)
```
