1 Overview

MyVariant.Info is a simple-to-use REST web service to query/retrieve genetic variant annotation from an aggregation of variant annotation resources. *myvariant* is an easy-to-use R wrapper to access MyVariant.Info services and explore variant annotations.

2 Variant Annotation Service

2.1 Obtaining HGVS IDs from a VCF file.

- Use `readVcf` from the VariantAnnotation package to read a Vcf file in. The Vcf object can then be passed to `formatHgvs` to retrieve HGVS IDs. HGVS IDs are based on the GRCh38/hg19 reference genome. Support for hg38 is coming soon.

```
> file.path <- system.file("extdata", "dbSNP_mini.vcf", package="myvariant")
> vcf <- readVcf(file.path, genome="hg19")
> rowRanges(vcf)

GRanges object with 240 ranges and 5 metadata columns:
          seqnames      ranges strand | paramRangeID      REF
              <Rle>    <IRanges>   <Rle> |      <factor> <DNAStringSet>
rs376643643       1 10019-10020     * |        NA      TA
rs373328635       1      10055     * |        NA      T
rs62651026        1      10108     * |        NA      C
rs376007522        1      10109     * |        NA      A
rs368469931        1      10139     * |        NA      A
...
rs544020171        1      17654     * |        NA      T
rs563880190        1      17694     * |        NA      C
rs574335987        1      17695     * |        NA      G
rs374995955        1      17697     * |        NA      G
rs543363182        1      17709     * |        NA      T
          ALT      QUAL      FILTER
          <DNAStringSetList> <numeric> <character>
rs376643643         T      NA      .
rs373328635         TA     NA      .
rs62651026          T      NA      .
rs376007522          T      NA      .
rs368469931          T      NA      .
...
rs544020171          C      NA      .
rs563880190          T      NA      .
rs574335987          A      NA      .
rs374995955          C      NA      .
rs543363182          G      NA      .
-----
seqinfo: 1 sequence from hg19 genome; no seqlengths
```

MyVariant.info R Client

- You can then use `formatHgvs` to extract HGVS IDs from the Vcf object.

```
> hgvs <- formatHgvs(vcf, variant_type="snp")
> head(hgvs)

[1] "1:g.10108C>T" "1:g.10109A>T" "1:g.10139A>T" "1:g.10150C>T" "1:g.10177A>C"
[6] "1:g.10180T>C"
```

2.2 getVariant

- Use `getVariant`, the wrapper for GET query of "/v1/variant/<hgvsid>" service, to return the variant object for the given HGVS id.

```
> variant <- getVariant("chr1:g.35367G>A")
> variant[[1]]$dbnsfp$genename

NULL

> variant[[1]]$cadd$phred

[1] 3.726
```

2.3 getVariants

- Use `getVariants`, the wrapper for POST query of "/v1/variant" service, to return the list of variant objects for the given character vector of HGVS ids.

```
> getVariants(c("chr1:g.35367G>A", "chr16:g.28883241A>G"),
+               fields="cadd.consequence")

DataFrame with 2 rows and 4 columns
      query          X_id    cadd._license
      <character>    <character>    <character>
1   chr1:g.35367G>A   chr1:g.35367G>A http://bit.ly/2TIuab9
2 chr16:g.28883241A>G chr16:g.28883241A>G http://bit.ly/2TIuab9
  cadd.consequence
      <character>
1 NONCODING_CHANGE
2 NON_SYNONYMOUS
```

3 Variant Query Service

3.1 queryVariant

- `queryVariant` is a wrapper for GET query of "/v1/query?q=<query>" service, to return the query result. This function accepts wild card input terms and allows you to query for variants that contain a specific annotation. For example, the following query searches for the CADD phred score and consequence for all variants whose genename (dbNSFP) is MLL2.

```
> queryVariant(q="dbnsfp.genename:MLL2", fields=c("cadd.phred", "cadd.consequence"))

$took
[1] 3

$total
[1] 0

$max_score
NULL

$hits
list()
```

- You can also use `queryVariant` to retrieve all annotations that map to a specific rsID.

```
> queryVariant(q="rs58991260", fields="dbsnp.flags")$hits

      _id   _score
1 chr1:g.218631822G>A 15.78942
```

3.2 queryVariants

- `queryVariants` is a wrapper for POST query of "/v1/query?q=<query>" service, to return the query result. Query terms include any available field as long as scopes are defined. The following example reads the dbSNP rsIDs from a VCF and queries for all fields. The returned DataFrame can then be easily subsetted to include, for example, those that have not been documented in the Wellderly study.

```
> rsids <- paste("rs", info(vcf)$RS, sep="")
> res <- queryVariants(q=rsids, scopes="dbsnp.rsid", fields="all")
```

MyVariant.info R Client

```
Finished
Pass returnall=TRUE to return lists of duplicate or missing query terms.

> subset(res, !is.na(wellderly.vartype))$query
