1 Introduction

This vignette investigates comparisons in performance between packages *matter* and related packages *bigmemory* [1] and *ff* [2], which also provide infrastructure for working with larger-than-memory datasets in R.

The examples demonstrated here are chosen because both linear regression and principal components analysis are statistical tasks common to many areas of bioinformatics.

The use of simulated data allows us to explore performance in a situation where file format is not an issue.

```
> library(matter)
```

2 Linear regression

```
> set.seed(81216)
> chunksize <- 10000
> n <- 1.5e7
> p <- 9
> b <- runif(p)
> names(b) <- paste0("x", 1:p)
> data <- data.frame(y=rnorm(n), check.rows=FALSE)
> for ( nm in names(b) ) {
+   xi <- rnorm(n)
+   data[[nm]] <- xi
+   data[["y"]] <- data[["y"]] + xi * b[nm]
+ }
> fm <- as.formula(paste0("y ~ ", paste0(names(b), collapse=" + ")))
> lm.prof <- list()
```

2.1 Using base R

```
> lm.prof[["base"]] <- profmem({
+   base.out <- lm(fm, data=data)
+ })
> rm(base.out)
> gc()

> print(lm.prof[["base"]])
  start (MB)  finish (MB) max used (MB) overhead (MB)    time (sec)
      1328.700      5582.900      7023.200      1440.300       33.299
```

2.2 Using bigmemory

```
> library(bigmemory)
> library(biganalytics)
> backingfile <- "lm-ex.bin"
> backingpath <- tempdir()
> descriptorfile <- "lm-ex.desc"
> data.bm <- filebacked.big.matrix(nrow=n, ncol=p + 1,
+   backingfile=backingfile,
+   backingpath=backingpath,
+   descriptorfile=descriptorfile,
+   dimnames=list(NULL, c("y", names(b))),
+   type="double")
> for ( nm in names(data) )
+   data.bm[,nm] <- data[[nm]]
> rm(data)
```

matter: Supplementary 1 - Simulations and comparative benchmarks

```
> gc()

> lm.prof[["bigmemory"]] <- profmem({
+ 
+     bm.out <- biglm.big.matrix(fm, data=data.bm, chunkszie=chunkszie)
+
+ })
> rm(bm.out)
> gc()

> print(lm.prof[["bigmemory"]])
  start (MB)   finish (MB) max used (MB) overhead (MB)    time (sec)
      388.900       389.200     4383.700      3994.500        21.557
```

2.3 Using ff

```
> library(ff)
> library(ffbbase)
> data.ff <- ff(filename=paste0(backingpath, "/", backingfile),
+ 
+     vmode="double", dim=c(n, p + 1),
+
+     dimnames=list(NULL, c("y", names(b))))
> data.ff <- as.ffdf(data.ff)

> lm.prof[["ff"]] <- profmem({
+ 
+     ff.out <- bigglm(fm, data=data.ff, chunkszie=chunkszie)
+
+ })
> rm(ff.out)
> gc()

> print(lm.prof[["ff"]])
  start (MB)   finish (MB) max used (MB) overhead (MB)    time (sec)
      392.300       393.300     1986.800      1593.500        56.987
```

2.4 Using matter

```
> data.m <- matter(paths=paste0(backingpath, "/", backingfile),
+ 
+     datemode="double", nrow=n, ncol=p + 1,
+
+     dimnames=list(NULL, c("y", names(b)))))

> lm.prof[["matter"]] <- profmem({
+ 
+     m.out <- bigglm(fm, data=data.m, chunkszie=chunkszie)
+
+ })
> rm(m.out)
```

matter: Supplementary 1 - Simulations and comparative benchmarks

```
> gc()

> print(lm.prof[["matter"]])
  start (MB)  finish (MB) max used (MB) overhead (MB)  time (sec)
    393.400     393.600    1054.100     660.500      47.175
```

3 Principal components analysis

```
> library(irlba)
> set.seed(81216)
> n <- 1.5e6
> p <- 100
> data <- matrix(nrow=n, ncol=p)
> for ( i in 1:10 )
+   data[,i] <- (1:n)/n + rnorm(n)
> for ( i in 11:20 )
+   data[,i] <- (n:1)/n + rnorm(n)
> for ( i in 21:p )
+   data[,i] <- rnorm(n)
> pca.prof <- list()
```

This again creates a 1.2 GB dataset in memory.

3.1 Using base R

First, we demonstrate

```
> pca.prof[["base"]] <- profmem({
+   base.out <- svd(data, nu=0, nv=2)
+ })
> rm(base.out)
> gc()

> print(pca.prof[["base"]])
  start (MB)  finish (MB) max used (MB) overhead (MB)  time (sec)
    1593.600    1593.700    3994.100    2400.400      66.231
```

3.2 Using bigmemory

```
> library(bigalgebra)
> backingfile <- "pca-ex.bin"
> backingpath <- tempdir()
> descriptorfile <- "pca-ex.desc"
> data.bm <- filebacked.big.matrix(nrow=n, ncol=p,
```

matter: Supplementary 1 - Simulations and comparative benchmarks

```
+      backingfile=backingfile,
+      backingpath=backingpath,
+      descriptorfile=descriptorfile,
+      type="double")
> for ( i in seq_len(ncol(data)) )
+      data.bm[,i] <- data[,i]
> rm(data)
> gc()
> mult.bm <- function(A, B) {
+   if ( is.vector(A) )
+     A <- t(A)
+   if ( is.vector(B) )
+     B <- as.matrix(B)
+   cbind((A %*% B)[])
+ }

> pca.prof[["bigmemory"]] <- profmem({
+   bm.out <- irlba(data.bm, nu=0, nv=2, mult=mult.bm)
+
+ })
> rm(bm.out)
> gc()

> print(pca.prof[["bigmemory"]])
  start (MB)  finish (MB) max used (MB) overhead (MB)    time (sec)
       393.900      406.400      3110.000      2703.600        15.391
```

3.3 Using ff

```
> library(bootSVD)
> data.ff <- ff(filename=paste0(backingpath, "/", backingfile),
+   vmode="double", dim=c(n, p))
> mult.ff <- function(A, B) {
+   if ( is.vector(A) )
+     A <- t(A)
+   if ( is.vector(B) )
+     B <- as.matrix(B)
+   cbind(ffmatrixmult(A, B)[])
+ }

> pca.prof[["ff"]] <- profmem({
+   ff.out <- irlba(data.ff, nu=0, nv=2, mult=mult.ff)
+
+ })
> rm(ff.out)
> gc()
```

matter: Supplementary 1 - Simulations and comparative benchmarks

Linear regression				Principle component analysis			
Method	Mem. used	Mem. overhead	Time	Method	Mem. used	Mem. overhead	Time
R matrices + lm	7 GB	1.4 GB	33 sec	R matrices + svd	3.9 GB	2.4 GB	6 sec
bigmemory + biglm	4.4 GB	3.9 GB	21 sec	bigmemory + irlba	3.1 GB	2.7 GB	11 sec
ff + biglm	1.9 GB	1.6 GB	57 sec	ff + irlba	1.8 GB	1.4 GB	13 sec
matter + biglm	1 GB	660 MB	47 sec	matter + irlba	890 MB	490 MB	11 sec

Table 1: Comparative performance of *matter* for linear regression and calculation of the first two principal components on simulated datasets of 1.2 GB

Memory overhead is the maximum memory used during the execution minus the memory in use upon completion.

```
> print(pca.prof[["ff"]])
start (MB)    finish (MB)  max used (MB)  overhead (MB)    time (sec)
 394.500      407.200     1790.400      1383.200      130.828
```

3.4 Using matter

```
> library(matter)
> data.m <- matter(paths=paste0(backingpath, "/", backingfile),
+                     datemode="double", nrow=n, ncol=p)
```

```
> pca.prof[["matter"]] <- profmem({
+   m.out <- irlba(data.m, nu=0, nv=2, fastpath=FALSE)
+ }
+ )
> rm(m.out)
> gc()
```

```
> print(pca.prof[["matter"]])
start (MB)    finish (MB)  max used (MB)  overhead (MB)    time (sec)
 395.400      407.400     893.900      486.500      110.884
```

4 Summary

Table 1 demonstrates that *matter* typically uses less memory than both *bigmemory* and *ff*. Additionally, it outperforms *ff* in speed. The reason for *bigmemory*'s superior speed is likely its use of `mmap` to map the on-disk data to virtual memory. This allows it to perform faster on datasets that can fit into available memory. However, this also uses more memory, because the much of the data ends up being loaded into memory. A comparison on real datasets that are much larger than memory (in the vignette “Supplementary 2 - 3D mass spectrometry imaging case study”) demonstrate the *matter* can be faster than *bigmemory* on datasets too large to be fully loaded into memory.
