### An R Package for Multiple Sequence Alignment

**Enrico Bonatesta, Christoph Kainrath, and Ulrich Bodenhofer**

Institute of Bioinformatics, Johannes Kepler University Linz

Altenberger Str. 69, 4040 Linz, Austria

*msa@bioinf.jku.at*

**Version 1.26.0, October 20, 2021**

## Scope and Purpose of this Document

This document provides a gentle introduction into the R package `msa`. Not all features of the R package are described in full detail. Such details can be obtained from the documentation enclosed in the R package. Further note the following: (1) this is not an introduction to multiple sequence alignment or algorithms for multiple sequence alignment; (2) this is not an introduction to R or any of the Bioconductor packages used in this document. If you lack the background for understanding this manual, you first have to read introductory literature on the subjects mentioned above.

## 1 Introduction

Multiple sequence alignment is one of the most fundamental tasks in bioinformatics. Algorithms like ClustalW [13], ClustalOmega [12], and MUSCLE [3, 4] are well known and widely used. However, all these algorithms are implemented as stand-alone command line programs without any integration into the R/Bioconductor ecosystem. Before the `msa` package, only the `muscle` package has been available in R, but no other multiple sequence alignment algorithm, although the `Biostrings` package has provided data types for representing multiple sequence alignments for quite some time. The `msa` package aims to close that gap by providing a unified R interface to the multiple sequence alignment algorithms ClustalW, ClustalOmega, and MUSCLE. The package requires no additional software packages and runs on all major platforms. Moreover, the `msa` package provides an R interface to the powerful L<sup>A</sup>T<sub>E</sub>X package `TeXshade` [1] which allows for a highly customizable plots of multiple sequence alignments. Unless some very special features of `TeXshade` are required, users can pretty-print multiple sequence alignments without the need to know the details of L<sup>A</sup>T<sub>E</sub>X or `TeXshade`.

## 2 Installation

The `msa` R package (current version: 1.26.0) is available via Bioconductor. The simplest way to install the package is the following:

```
if (!requireNamespace("BiocManager", quietly=TRUE))
  install.packages("BiocManager")
BiocManager::install("msa")
```

To test the installation of the `msa` package, enter

```
library(msa)
```

in your R session. If this command terminates without any error message or warning, you can be sure that the `msa` package has been installed successfully. If so, the `msa` package is ready for use now and you can start performing multiple sequence alignments.

To make use of all functionalities of `msaPrettyPrint()`, a L<sup>A</sup>T<sub>E</sub>X system [5] must be installed. To make use of L<sup>A</sup>T<sub>E</sub>X code created by `msaPrettyPrint()` or to use the output of `msaPrettyPrint()` in Sweave [6] or knitr [15] documents, the L<sup>A</sup>T<sub>E</sub>X package `TeXshade` (file `texshade.sty`) [1] must be accessible to the L<sup>A</sup>T<sub>E</sub>X system too. The file `texshade.sty` is shipped with the `msa` package. To determine where the file is located, enter the following command in your R session:

```
system.file("tex", "texshade.sty", package="msa")
```

Alternatively, `TeXshade` can be installed directly from the Comprehensive TeX Archive Network (CTAN).<sup>1</sup>

<sup>1</sup><https://www.ctan.org/pkg/texshade>

### 3 msa for the Impatient

In order to illustrate the basic workflow, this section presents a simple example with default settings and without going into the details of each step. Let us first load amino acid sequences from one of the example files that are supplied with the `msa` package:

```
mySequenceFile <- system.file("examples", "exampleAA.fasta", package="msa")
mySequences <- readAAStringSet(mySequenceFile)
mySequences

## AAStringSet object of length 9:
##      width seq                         names
## [1]    452 MSTAVLENPGLGRKLS...NSEIGILCSALQKIK PH4H_Homo_sapiens
## [2]    453 MAAVVELENGVLSRKLS...SEVGILCNALQKIKS PH4H_Rattus_norve...
## [3]    453 MAAVVELENGVLSRKLS...SEVGILCHALQKIKS PH4H_Mus_musculus
## [4]    297 MNDRADFVVPDITTRK...LNAGDRQGWADTEDV PH4H_Chromobacter...
## [5]    262 MKTTQYVARQPDDNGF...RLGLHAPLFPPKQAA PH4H_Pseudomonas_...
## [6]    451 MSALVLESRALGRKLS...SSEVEILCSALQKLK PH4H_Bos_taurus
## [7]    313 MAIATPTSAAPTPAPA...LNAGTREGWADTADI PH4H_Ralstonia_so...
## [8]    294 MSGDGLSNGPPPARGP...AYATAGGRLAGAAAG PH4H_Caulobacter...
## [9]    275 MSVAEYARDCAAQGLR...VARRKDQKALDPATV PH4H_Rhizobium_loti
```

Now that we have loaded the sequences, we can run the `msa()` function which, by default, runs ClustalW with default parameters:

```
myFirstAlignment <- msa(mySequences)

## use default substitution matrix

myFirstAlignment

## CLUSTAL 2.1
##
## Call:
##   msa(mySequences)
##
## MsaAAMultipleAlignment with 9 rows and 456 columns
##      aln                         names
## [1] MAAVVELENGVLSRKLSDF...SINSEVGILCNALQKIKS PH4H_Rattus_norve...
## [2] MAAVVELENGVLSRKLSDF...SINSEVGILCHALQKIKS PH4H_Mus_musculus
## [3] MSTAVLENPGLGRKLSDF...SINSEIGILCSALQKIK- PH4H_Homo_sapiens
## [4] MSALVLESRALGRKLSDF...SISSEVEILCSALQKLK- PH4H_Bos_taurus
## [5] -----GWADTEDV----- PH4H_Chromobacter...
## [6] -----GWADTADI----- PH4H_Ralstonia_so...
## [7] -----AYATAGGRLAGAAAG--- PH4H_Caulobacter...
```

```
## [8] -----...----- PH4H_Pseudomonas_...
## [9] -----...----- PH4H_Rhizobium_loti
## Con -----??????IL??A???--- Consensus
```

Obviously, the default printing function shortens the alignment for the sake of compact output. The `print()` function provided by the `msa` package provides some ways for customizing the output, such as, showing the entire alignment split over multiple blocks of sub-sequences:

```
print(myFirstAlignment, show="complete")

```

The `msa` package additionally offers the function `msaPrettyPrint()` which allows for pretty-printing multiple alignments using the `LATEX` package `TeXshade`. As an example, the following R code creates a PDF file `myfirstAlignment.pdf` which is shown in Figure 1:

```
msaPrettyPrint(myFirstAlignment, output="pdf", showNames="none",
               showLogo="none", askForOverwrite=FALSE, verbose=FALSE)
```

In the above call to `msaPrettyPrint()`, the printing of sequence names has been suppressed by `showNames="none"`. The settings `askForOverwrite=FALSE` and `verbose=FALSE` are necessary for building this vignette, but, in an interactive R session, they are not necessary.

Almost needless to say, the file names created by `msaPrettyPrint()` are customizable. By default, the name of the argument is taken as file name. More importantly, the actual output of `msaPrettyPrint()` is highly customizable, too. For more details, see the Section 7 and the help page of the function (`?msaPrettyPrint`).

The `msaPrettyPrint()` function is particularly useful for pretty-printing multiple sequence alignments in Sweave [6] or knitr [15] documents. More details are provided in Section 7. Here, we restrict to a teasing example:

```
msaPrettyPrint(myFirstAlignment, y=c(164, 213), output="asis",
               showNames="none", showLogo="none", askForOverwrite=FALSE)
```

## 4 Functions for Multiple Sequence Alignment in More Detail

The example in Section 3 above simply called the function `msa()` without any additional arguments. We mentioned already that, in this case, ClustalW is called with default parameters. We can also explicitly request ClustalW or one of the two other algorithms ClustalOmega or MUSCLE:

```

myClustalWAlignment <- msa(mySequences, "ClustalW")

## use default substitution matrix

myClustalWAlignment

## CLUSTAL 2.1
##
## Call:
##   msa(mySequences, "ClustalW")
##
## MsaAMultipleAlignment with 9 rows and 456 columns

```

Please note that the call `msa(mySequences, "ClustalW", ...)` is just a shortcut for the call `msaClustalW(mySequences, ...)`, analogously for `msaClustalOmega()` and `msaMuscle()`.

In other words, `msa()` is nothing else but a wrapper function that provides a unified interface to the three functions `msaClustalW()`, `msaClustalOmega()`, and `msaMuscle()`.

All three functions `msaClustalW()`, `msaClustalOmega()`, and `msaMuscle()` have the same parameters: The input sequences are passed as argument `inputSeqs`, and all functions have the following arguments: `cluster`, `gapOpening`, `gapExtension`, `maxiters`, `substitutionMatrix`, `order`, `type`, and `verbose`. The ways these parameters are interpreted, are largely analogous, although there are some differences, also in terms of default values. See the subsections below and the man page of the three functions for more details. All of the three functions `msaClustalW()`, `msaClustalOmega()`, and `msaMuscle()`, however, are not restricted to the parameters mentioned above. All three have a ‘...’ argument through which several other algorithm-specific parameters can be passed on to the underlying library. The following subsections provide an overview of which parameters are supported by each of the three algorithms.

## 4.1 ClustalW-Specific Parameters

The original implementation of ClustalW offers a lot of parameters for customizing the way a multiple sequence alignment is computed. Through the ‘...’ argument, `msaClustalW()` provides an interface to make use of most these parameters (see the documentation of ClustalW<sup>2</sup> for a comprehensive overview). Currently, the following restrictions and caveats apply:

- The parameters `infile`, `clustering`, `gapOpen`, `gapExt`, `numiters`, `matrix`, and `outorder` have been renamed to the standardized argument names `inputSeqs`, `cluster`, `gapOpening`, `gapExtension`, `maxiters`, `substitutionMatrix`, and `order` in order to provide a consistent interface for all three multiple sequence alignment algorithms.
- Boolean flags must be passed as logical values, e.g. `verbose=TRUE`.
- The parameter `quiet` has been replaced by `verbose` (with the exact opposite meaning).
- The following parameters are (currently) not supported: `bootstrap`, `check`, `fullhelp`, `interactive`, `maxseqlen`, `options`, and `tree`.
- For the parameter `output`, only the choice "clustal" is available.

## 4.2 ClustalOmega-Specific Parameters

In the same way as ClustalW, the original implementation of ClustalOmega also offers a lot of parameters for customizing the way a multiple sequence alignment is computed. Through the ‘...’ argument, `msaClustalOmega()` provides an interface to make use of most these parameters (see the documentation of ClustalOmega<sup>3</sup> for a comprehensive overview). Currently, the following restrictions and caveats apply:

- The parameters `infile`, `cluster-size`, `iterations`, and `output-order` have been renamed to the argument names `inputSeqs`, `cluster`, `maxiters`, and `order` in order to provide a consistent interface for all three multiple sequence alignment algorithms.

---

<sup>2</sup>[http://www.clustal.org/download/clustalw\\_help.txt](http://www.clustal.org/download/clustalw_help.txt)

<sup>3</sup><http://www.clustal.org/omega/README>

- ClustalOmega does not allow for setting custom gap penalties. Therefore, setting the parameters `gapOpening` and `gapExtension` currently has no effect and will lead to a warning. These arguments are only defined for future extensions and consistency with the other algorithms available in `msa`.
- ClustalOmega only allows for choosing substitution matrices from a pre-defined set of names, namely "BLOSUM30", "BLOSUM40", "BLOSUM50", "BLOSUM65", "BLOSUM80", and "Gonnet". This is a new feature — the original ClustalOmega implementation does not allow for using any custom substitution matrix. However, since these are all amino acid substitution matrices, ClustalOmega is still hardly useful for multiple alignments of nucleotide sequences.
- Boolean flags must be passed as logical values, e.g. `verbose=TRUE`.
- The following parameters are (currently) not supported: `maxSeqLength` and `help`.
- For the parameter `outFmt`, only the choice "clustal" is available.

### 4.3 MUSCLE-Specific Parameters

Finally, also MUSCLE offers a lot of parameters for customizing the way a multiple sequence alignment is computed. Through the ‘...’ argument, `msaMuscle()` provides an interface to make use of most these parameters (see the documentation of MUSCLE<sup>4</sup> for a comprehensive overview). Currently, the following restrictions and caveats apply:

- The parameters `in`, `gapOpen`, `gapExtend`, `matrix`, and `seqtype` have been renamed to `inputSeqs`, `gapOpening`, `gapExtension`, `substitutionMatrix` and `type` in order to provide a consistent interface for all three multiple sequence alignment algorithms.
- Boolean flags must be passed as logical values, e.g. `verbose=TRUE`.
- The parameter `quiet` has been replaced by `verbose` (with the exact opposite meaning).
- The following parameters are currently not supported: `clw`, `clwstrict`, `fastaout`, `group`, `html`, `in1`, `in2`, `log`, `loga`, `msaout`, `msf`, `out`, `phyi`, `phyiout`, `phys`, `physout`, `refine`, `refinew`, `scorefile`, `spscore`, `stable`, `termgaps4`, `termgapsfull`, `termgapshalf`, `termgapshalflonger`, `tree1`, `tree2`, `usetree`, `weight1`, and `weight2`.

## 5 Printing Multiple Sequence Alignments

As already shown above, multiple sequence alignments can be shown in plain text format on the R console using the `print()` function (which is implicitly called if just the object name is entered on the R console). This function allows for multiple customizations, such as, enabling/disabling to display a consensus sequence, printing the entire alignment or only a subset, enabling/disabling to display sequence names, and adjusting the width allocated for sequence names. For more information, the reader is referred to the help page of the `print` function:

---

<sup>4</sup><http://www.drive5.com/muscle/muscle.html>

```
help("print,MsaDNAMultipleAlignment-method")
```

We only provide some examples here:

```
print(myFirstAlignment)

## 6 Processing Multiple Alignments

### 6.1 Methods Inherited From Biostrings

The classes defined by the `msa` package for storing multiple alignment results have been derived from the corresponding classes defined by the `Biostrings` package. Therefore, all methods for processing multiple alignments are available and work without any practical limitation. In this section, we highlight some of these.

The classes used for storing multiple alignments allow for defining masks on sequences and sequence positions via their row and column mask slots. They can be set by `rowmask()` and `colmask()` functions which serve both as setter and getter functions. To set row or column masks, an `IRanges` object must be supplied:

```
myMaskedAlignment <- myFirstAlignment
colM <- IRanges(start=1, end=100)
colmask(myMaskedAlignment) <- colM
myMaskedAlignment

## CLUSTAL 2.1
##
## Call:
##   msa(mySequences)
##
## MsaAAMultipleAlignment with 9 rows and 456 columns
##      aln                      names
## [1] #####...SINSEVGILCNALQKIKS PH4H_Rattus_norve...
## [2] #####...SINSEVGILCHALQKIKS PH4H_Mus_musculus
## [3] #####...SINSEIGILCSALQKIK- PH4H_Homo_sapiens
## [4] #####...SISSEVEILCSALQKLK- PH4H_Bos_taurus
## [5] #####...GWADTEDV----- PH4H_Chromobacter...
```

```

## [6] #####.GWADTADI----- PH4H_Ralstonia_so...
## [7] #####.AYATAGGRLAGAAAG--- PH4H_Caulobacter_...
## [8] #####.----- PH4H_Pseudomonas_...
## [9] #####.----- PH4H_Rhizobium_loti
## Con #####.?????IL??A???--- Consensus

```

The `unmasked()` allows for removing these masks, thereby casting the multiple alignment to a set of aligned `Biostrings` sequences (class `AAStringSet`, `DNAStringSet`, or `RNAStringSet`):

```

unmasked(myMaskedAlignment)

## AAStringSet object of length 9:
##      width seq                         names
## [1] 456 MAAVVLENGVLSRKLS...SEVGILCNALQKIKS PH4H_Rattus_norve...
## [2] 456 MAAVVLENGVLSRKLS...SEVGILCHALQKIKS PH4H_Mus_musculus
## [3] 456 MSTAVLENPGLGRKLS...SEIGILCSALQKIK- PH4H_Homo_sapiens
## [4] 456 MSALVLESRALGRKLS...SEVEILCSALQKLK- PH4H_Bos_taurus
## [5] 456 -----DTEDV----- PH4H_Chromobacter...
## [6] 456 -----DTADI----- PH4H_Ralstonia_so...
## [7] 456 -----TAGGRLAGAAAG--- PH4H_Caulobacter_...
## [8] 456 -----...----- PH4H_Pseudomonas_...
## [9] 456 -----...----- PH4H_Rhizobium_loti

```

Consensus matrices can be computed conveniently as follows:

```

conMat <- consensusMatrix(myFirstAlignment)
dim(conMat)

## [1] 21 456

conMat[, 101:110]

## [,1] [,2] [,3] [,4] [,5] [,6] [,7] [,8] [,9] [,10]
## - 5 5 5 5 5 5 5 5 5 5
## A 0 0 0 4 0 0 0 0 0 0
## C 0 0 0 0 0 0 0 0 0 0
## D 4 0 0 0 0 0 0 0 0 0
## E 0 0 0 0 0 0 0 4 0 0
## F 0 0 0 0 0 0 0 0 0 0
## G 0 0 4 0 0 0 0 0 0 0
## H 0 0 0 0 0 0 4 0 0 0
## I 0 4 0 0 0 0 0 0 0 0
## K 0 0 0 0 0 0 0 0 0 0
## L 0 0 0 0 0 0 0 0 4 0

```

```
## M 0 0 0 0 0 0 0 0 0 0
## N 0 0 0 0 0 0 0 0 0 0
## P 0 0 0 0 0 0 0 0 0 0
## Q 0 0 0 0 0 0 0 0 0 0
## R 0 0 0 0 0 0 0 0 0 0
## S 0 0 0 0 0 0 0 0 0 4
## T 0 0 0 0 4 0 0 0 0 0
## V 0 0 0 0 0 4 0 0 0 0
## W 0 0 0 0 0 0 0 0 0 0
## Y 0 0 0 0 0 0 0 0 0 0
```

If called on a masked alignment, `consensusMatrix()` only uses those sequences/rows that are not masked. If there are masked columns, the matrix contains NA's in those columns:

```
conMat <- consensusMatrix(myMaskedAlignment)
conMat[, 95:104]

## [,1] [,2] [,3] [,4] [,5] [,6] [,7] [,8] [,9] [,10]
## - NA NA NA NA NA NA 5 5 5 5
## A NA NA NA NA NA NA 0 0 0 4
## C NA NA NA NA NA NA 0 0 0 0
## D NA NA NA NA NA NA 4 0 0 0
## E NA NA NA NA NA NA 0 0 0 0
## F NA NA NA NA NA NA 0 0 0 0
## G NA NA NA NA NA NA 0 0 4 0
## H NA NA NA NA NA NA 0 0 0 0
## I NA NA NA NA NA NA 0 4 0 0
## K NA NA NA NA NA NA 0 0 0 0
## L NA NA NA NA NA NA 0 0 0 0
## M NA NA NA NA NA NA 0 0 0 0
## N NA NA NA NA NA NA 0 0 0 0
## P NA NA NA NA NA NA 0 0 0 0
## Q NA NA NA NA NA NA 0 0 0 0
## R NA NA NA NA NA NA 0 0 0 0
## S NA NA NA NA NA NA 0 0 0 0
## T NA NA NA NA NA NA 0 0 0 0
## V NA NA NA NA NA NA 0 0 0 0
## W NA NA NA NA NA NA 0 0 0 0
## Y NA NA NA NA NA NA 0 0 0 0
```

Multiple alignments also inherit the `consensusString()` method from the `Biostrings` package. However, for more flexibility and consistency, we rather advise users to use the method `msaConsensusSequence()` method (see below).

## 6.2 Consensus Sequences and Conservation Scores

With version 1.7.1 of `msa`, new methods have been provided that allow for the computation of consensus sequences and conservation scores. By default, the `msaConsensusSequence()` method is a wrapper around the `consensusString()` method from the `Biostrings`:

```
printSplitString <- function(x, width=getOption("width") - 1)
{
  starts <- seq(from=1, to=nchar(x), by=width)

  for (i in 1:length(starts))
    cat(substr(x, starts[i], starts[i] + width - 1), "\n")
}

printSplitString(msaConsensusSequence(myFirstAlignment))

## -----
## -----
## ???????Y????D?????R?Q????P?P???YTEEE??TW?TL??
## RQ??L????AC?E???G?---?LG???D?IPQLE?VSQ?LQ??TGWR???VPGL?P???FF?
## ?LA?R?FP?TQ?IR????LDY??EPDIFHELPFGHVPLLSDP?FA?F?Q?YG?LA???A?????E
## ?LARLYW?TVEFGL????-???KAYGAGLLSSF?ELQYCLSD-?P???PF?LE??M?T?Y?ID?
## FQPLYFV??SF??L?E??R??D?T????????P????V?D?????????????IL?
## ?A???---
```

However, there is also a second method for computing consensus sequence that has been implemented in line with a consensus sequence method implemented in `TeXshade` that allows for specify an upper and a lower conservation threshold (see example below). This method can be accessed via the argument `type="upperlower"`. Additional customizations are available, too:

```
printSplitString(msaConsensusSequence(myFirstAlignment, type="upperlower",
                                      thresh=c(40, 20)))

## -----
## -----
## .....y....d.....d.....r.q.....p.p...Yteee..tW.Tl..
## rq..l....Ac.e....g.----lg...d.iPqle.vsq.Lq..TGwr...VpgL.p...Ff.
## .LA.r.Fp.tq.iR....ldY..EPDifHelpGHvPllsdp.FA.f.q.yG.la....a....e
## .larlyW.TvEfGL....-....kayGaGllSSf.Elqyclsd-.p...pf.le..m.t.Y.id.
## fQplyfV..sf..l.e...r..d.t.....p.....v.d.....il.
## .a....---
```

Regardless of which method is used, masks are taken into account: masked rows/sequences are neglected and masked columns are shown as “#” in the consensus sequence:

```
printSplitString(msaConsensusSequence(myMaskedAlignment, type="upperlower",
                                         thresh=c(40, 20)))
```

```
## #####-----.
## .....y....d.....d.....r.q.....p.p...Yteee..tW.Tl..
## rq..l....Ac.e....g----lg...d.iPqle.vsq.Lq..TGwr...VpgL.p...Ff.
## .LA.r.Fp.tq.iR....ldY..EPDifHelpGHvPllsdp.FA.f.q.yG.la...a....e
## .lar1YW.TvEfGL....-...kayGaGllSSf.Elqyclsd-.p...pf.le..m.t.Y.id.
## fQplyfV..sf..l.e..r..d.t.....p.....v.d.....il.
## .a...--
```

The main purpose of consensus sequences is to get an impression of conservation at individual positions/columns of a multiple alignment. The `msa` package also provides another means of analyzing conservation: the method `msaConservationScore()` computes sums of pairwise scores for a given substitution/scoring matrix. Thereby, conservation can also be analyzed in a more sensible way than by only taking relative frequencies of letters into account as `msaConsensusSequence()` does.

```

data(BLOSUM62)
msaConservationScore(myFirstAlignment, BLOSUM62)

```

As the above example shows, a substitution matrix must be provided. The result is obviously a vector as long as the alignment has columns. The entries of the vector are labeled by the consensus sequence. The way the consensus sequence is computed can be customized:

```

## 288 141 296 567 183 196 181 145 228 236 189 20 324

##   -
## -96

```

The additional argument `gapVsGap` allows for controlling how pairs of gap are taken into account when computing pairwise scores (see `?msaConservationScore` for more details).

Conservation scores can also be computed from masked alignments. For masked columns, NA's are returned:

```
msaConservationScore(myMaskedAlignment, BLOSUM62, gapVsGap=0,
                      type="upperlower", thresh=c(40, 20))
```

```

### 6.3 Interfacing to Other Packages

There are also other sequence analysis packages that use or make use of multiple sequence alignments. The `msa` package does not directly interface to these packages in order to avoid dependencies and possible incompatibilities. However, `msa` provides a function `msaConvert()` that allows for converting multiple sequence alignment objects to other types/classes. Currently, five such conversions are available, namely to the classes `alignment` (`seqinr` package [2]), `align` (`bios2mds` package [14]), `AAbin/DNAbin` (`ape` package [10]), and `phyDat` (`phangorn` package [11]). Except for the conversion to the class `phyDat`, these conversion are performed without loading or depending on the respective packages.

In the following example, we perform a multiple alignment of Hemoglobin alpha example sequences and convert the result for later processing with the `seqinr` package:

```

hemoSeq <- readAAStringSet(system.file("examples/HemoglobinAA.fasta",
                                         package="msa"))
hemoAln <- msa(hemoSeq)

## use default substitution matrix

```

```

hemoAln

## CLUSTAL 2.1
##
## Call:
##   msa(hemoSeq)
##
## MsaAAMultipleAlignment with 17 rows and 143 columns
##   aln           names

## [17] -SLSDTDKAVVKAIWAKI...VDKFFNNLALALSEKYR HBA1_Danio_rerio
## Con -VLS?ADK?NVKA?WGK?...LDKFLA?VSTVLTSKYR Consensus

hemoAln2 <- msaConvert(hemoAln, type="seqinr::alignment")

```

Now we compute a distance matrix using the `dist.alignment()` function from the `seqinr` package:

```

library(seqinr)

d <- dist.alignment(hemoAln2, "identity")
as.matrix(d)[2:5, "HBA1_Homo_sapiens", drop=FALSE]

##
##           HBA1_Homo_sapiens
## HBA1_Pan_troglodytes      0.0000000
## HBA1_Macaca_mulatta      0.1684304
## HBA1_Bos_taurus          0.3472281
## HBA1_Tursiops_truncatus 0.4038819

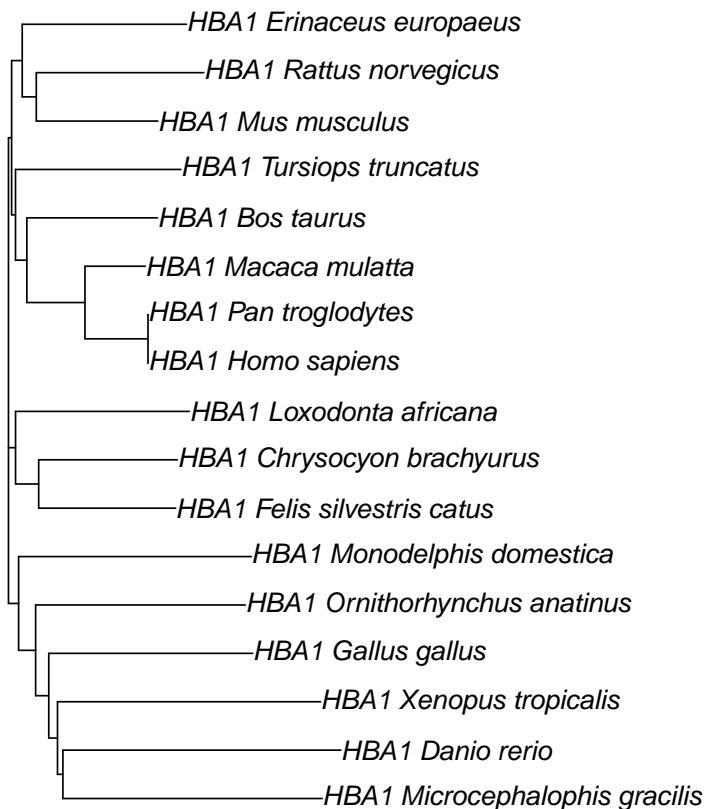

```

Now we can construct a phylogenetic tree with the neighbor joining algorithm using the `nj()` function from the `ape` package:

```
library(ape)

hemoTree <- nj(d)
plot(hemoTree, main="Phylogenetic Tree of Hemoglobin Alpha Sequences")
```

### Phylogenetic Tree of Hemoglobin Alpha Sequences

The following example shows how to convert a multiple alignment object in an object of class `align` as defined by the `bios2mds` package:

```
hemoAln3 <- msaConvert(hemoAln, type="bios2mds::align")
str(hemoAln3)

## List of 17

```

The conversions to the standard `Biostrings` classes are straightforward using standard `as()` methods and not provided by the `msaConvert()` function. The following example converts a multiple alignment object to class `BStringSet` (e.g. the `msaplot()` function from the `ggtree` package [16] accepts `BStringSet` objects):

```

hemoAln4 <- as(hemoAln, "BStringSet")
hemoAln4

## BStringSet object of length 17:

```

**Note:** The `msaConvert()` function has been introduced in version 1.3.3 of the `msa` package. So, to have this function available, at least Bioconductor 3.3 is required, which requires at least R 3.3.0.

## 7 Pretty-Printing Multiple Sequence Alignments

As already mentioned above, the `msa` package offers the function `msaPrettyPrint()` which allows for pretty-printing multiple sequence alignments using the `LATEX` package `TEXshade` [1]. Which prerequisites are necessary to take full advantage of the `msaPrettyPrint()` function is described in Section 2.

The `msaPrettyPrint()` function writes a multiple sequence alignment to an alignment (`.aln`) file and then creates  $\text{\LaTeX}$  code for pretty-printing the multiple sequence alignment on the basis of the  $\text{\LaTeX}$  package `TeXshade`. Depending on the choice of the `output` argument, the function `msaPrettyPrint()` either prints a  $\text{\LaTeX}$  fragment to the R session (choice `output="asis"`) or writes a  $\text{\LaTeX}$  source file (choice `output="tex"`) that it processes to a DVI file (choice `output="dvi"`) or PDF file (choice `output="pdf"`). Note that no extra software is needed for choices `output="asis"` and `output="tex"`. For `output="dvi"` and `output="pdf"`, however, a  $\text{\TeX}/\text{\LaTeX}$  distribution must be installed in order to translate the  $\text{\LaTeX}$  source file into the desired target format (DVI or PDF).

The function `msaPrettyPrint()` allows for making the most common settings directly and conveniently via an R interface without the need to know the details of L<sup>A</sup>T<sub>E</sub>X or T<sub>E</sub>Xshade. In the following, we will describe some of these customizations. For all possibilities, the user is referred to the documentation of T<sub>E</sub>Xshade.<sup>5</sup>

## 7.1 Consensus Sequence and Sequence Logo

The consensus sequence of the alignment is one of the most important results of a multiple sequence alignment. `msaPrettyPrint()` has a standard possibility to show this consensus sequence with the parameter `showConsensus`. The default value is "bottom", which results in the following:

```
msaPrettyPrint(myFirstAlignment, output="asis", y=c(164, 213),  
subset=c(1:6), showNames="none", showLogo="none",  
consensusColor="ColdHot", showLegend=FALSE,  
askForOverwrite=FALSE)
```

Consensus sequences can also be displayed on top of a multiple sequence alignment or omitted completely.

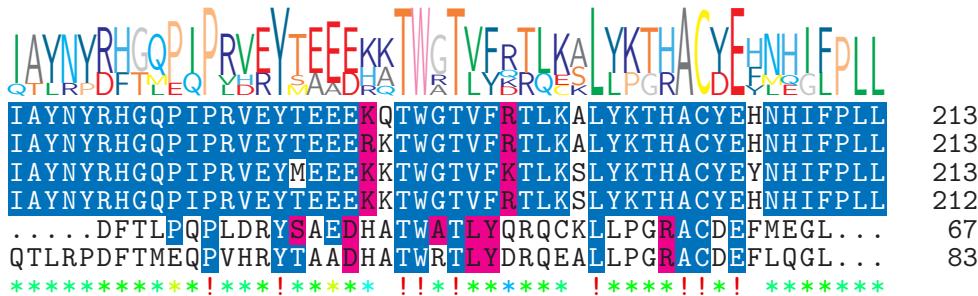

<sup>5</sup><https://www.ctan.org/pkg/texshade>

In the above example, an exclamation mark ‘!’ in the consensus sequence stands for a conserved letter, i.e. a sequence positions in which all sequences agree, whereas an asterisk ‘\*’ stands for positions in which there is a majority of sequences agreeing. Positions in which the sequences disagree are left blank in the consensus sequence. For a more advanced example how to customize the consensus sequence, see the example in Subsection 7.4 below.

The color scheme of the consensus sequence can be configured with the `consensusColors` parameter. Possible values are "ColdHot", "HotCold", "BlueRed", "RedBlue", "GreenRed", "RedGreen", or "Gray". The above example uses the color scheme "RedGreen".

Additionally, `msaPrettyPrint()` also offers a more sophisticated visual representation of the consensus sequence — sequence logos. Sequence logos can be displayed either on top of the multiple sequence alignment (`showLogo="top"`), below the multiple sequence alignment (`showLogo="bottom"`), or omitted at all (`showLogo="none"`):

```
msaPrettyPrint(myFirstAlignment, output="asis", y=c(164, 213),
               subset=c(1:6), showNames="none", showLogo="top",
               logoColors="rasmol", shadingMode="similar",
               showLegend=FALSE, askForOverwrite=FALSE)
```

The color scheme of the sequence logo can be configured with the `logoColors` parameter. Possible values are "chemical", "rasmol", "hydropathy", "structure", "standard area", and "accessible area". The above example uses the color scheme "rasmol".

Note that a consensus sequence and a sequence logo can be displayed together, but only on opposite sides.

Finally, a caveat: for computing consensus sequences, `msaPrettyPrint()` uses the functionality provided by `TeXshade`, therefore, the results need not match to the results of the methods described in Section 6 above.

## 7.2 Color Shading Modes

`TeXshade` offers different shading schemes for displaying the multiple sequence alignment itself. The following schemes are available: "similar", "identical", and "functional". Moreover, there are five different color schemes available for shading: "blues", "reds", "greens", "grays", or "black". The following example uses the shading mode "similar" along with the color scheme "blues":

```
msaPrettyPrint(myFirstAlignment, output="asis", y=c(164, 213),
               showNames="none", shadingMode="similar",
               shadingColors="blues", showLogo="none",
               showLegend=FALSE, askForOverwrite=FALSE)
```

```
IAYNYRHGQPIPRVEYTEEKKQTWGTVFRTLKALYKTHACYEHNHIFPLL 213
IAYNYRHGQPIPRVEYTEEERKQTWGTVFRTLKALYKTHACYEHNHIFPLL 213
IAYNYRHGQPIPRVEYMEEEEKKQTWGTVFKTLKSLYKTHACYEYNHIFPLL 213
IAYNYRHGQPIPRVEYTEEKKQTWGTVFRTLKSLYKTHACYEHNHIFPLL 212
.....DFTLPQPLDRYSAEEDHATWATLYQRQCKLLPGRACDEFMEGL... 67
QTLRPDFTMEQPVHRYTAADHATWRTRLYDRQEALLPGRACDEFQGL... 83
.....PDWTIDQGWETYTQAEHDVWITLYERQTDMLHGRACDEFMRGL... 58
.....DNGFIHYPETEHQVWNNTLITRQLKVITEGRACQEYLDGI... 50
.VCRADFTVAQDYD.YSDEEQAVWRTLCDRQTKLTRKLAHHSYLDGV... 65
*** * ! *** * ! * ! * * * * * ! * *** *
```

If the shading modes "similar" or "identical" are used, the `shadingModeArg` argument allows for setting a similarity threshold (a numerical value between 0 and 100). For shading mode "functional", the following settings of the `shadingModeArg` argument are possible: "charge", "hydropathy", "structure", "hematic", "rasmol", "standard area", and "accessible area". The following example uses shading mode "functional" along with `shadingModeArg` set to "structure":

```
msaPrettyPrint(myFirstAlignment, output="asis", y=c(164, 213),
               showNames="none", shadingMode="functional",
               shadingModeArg="structure",
               askForOverwrite=FALSE)
```

The figure shows a multiple sequence alignment with functional shading mode 'structure'. The sequences are color-coded based on their structural similarity. A legend at the bottom left defines the colors:

- X external
- X ambivalent
- X internal

The alignment shows several sequences, each with a unique color scheme. The sequences are:

```
IAYNYRHGQPIPRVEYTEEKKQTWGTVFRTLKALYKTHACYEHNHIFPLL 213
IAYNYRHGQPIPRVEYTEEERKQTWGTVFRTLKALYKTHACYEHNHIFPLL 213
IAYNYRHGQPIPRVEYMEEEEKKQTWGTVFKTLKSLYKTHACYEYNHIFPLL 213
IAYNYRHGQPIPRVEYTEEKKQTWGTVFRTLKSLYKTHACYEHNHIFPLL 212
.....DFTLPQPLDRYSAEEDHATWATLYQRQCKLLPGRACDEFMEGL... 67
QTLRPDFTMEQPVHRYTAADHATWRTRLYDRQEALLPGRACDEFQGL... 83
.....PDWTIDQGWETYTQAEHDVWITLYERQTDMLHGRACDEFMRGL... 58
.....DNGFIHYPETEHQVWNNTLITRQLKVITEGRACQEYLDGI... 50
.VCRADFTVAQDYD.YSDEEQAVWRTLCDRQTKLTRKLAHHSYLDGV... 65
```

X external  
X ambivalent  
X internal

In the above example, a legend is shown that specifies the meaning of the color codes with which the letters are shaded. In some of the other examples above, we have suppressed this legend with the option `showLegend=FALSE`. The default, however, is that a legend is printed underneath the multiple sequence alignment like in the previous example.

### 7.3 Subsetting

In case that not the complete multiple sequence alignment should be printed, `msaPrettyPrint()` offers two ways of sub-setting. On the one hand, the `subset` argument allows for selecting only a subset of sequences. Not surprisingly, `subset` must be a numeric vector with indices of sequences to be selected. On the other hand, it is also possible to slice out certain positions of the multiple sequence alignment using the `y` argument. In the simplest case, `y` can be a numeric vector with two elements in ascending order which correspond to the left and right bounds between which the multiple sequence alignment should be displayed. However, it is also possible to slice out multiple windows. For this purpose, the argument `y` must be an `IRanges` object containing the starts and ends of the windows to be selected.

### 7.4 Additional Customizations

The `msaPrettyPrint()` function provides an interface to the most common functionality of `TeXshade` in a way that the user does not need to know the specific commands of `TeXshade`. `TeXshade`, however, provides a host of additional customizations many of which are not covered by the interface of the `msaPrettyPrint()` function. In order to allow users to make use of all functionality of `TeXshade`, `msaPrettyPrint()` offers the `furtherCode` argument through which users can add `LATEX` code to the `texshade` environment that is created by `msaPrettyPrint()`. Moreover, the `code` argument can be used to bypass all of `msaPrettyPrint()`'s generation of `TeXshade` code.

Here is an example how to use the `furtherCode` argument in order to customize the consensus sequence and to show a ruler on top:

```
msaPrettyPrint(myFirstAlignment, output="asis", y=c(164, 213),
              subset=c(1:6), showNames="none", showLogo="none",
              consensusColor="ColdHot", showLegend=FALSE,
              shadingMode="similar", askForOverwrite=FALSE,
              furtherCode=c("\\defconsensus{.}{lower}{upper}",
                           "\\showruler{1}{top}"))
```

| 170         | 180           | 190         | 200                    | 210               |     |

### 7.5 SWeave or knitr Integration

The function `msaPrettyPrint()` is particularly well-suited for pretty-printing multiple alignments in SWeave [6] or knitr [15] documents. The key is to set `output` to "asis" when calling

`msaPrettyPrint()` and, at the same time, to let the R code chunk produce output that is directly included in the resulting L<sup>A</sup>T<sub>E</sub>X document as it is. This can be accomplished with the code chunk option `results="tex"` in Sweave and with the code chunk option `results="asis"` in knitr. Here is an example of a Sweave code chunk that displays a pretty-printed multiple sequence alignment inline:

```
<<AnyChunkName,results="tex">>=
msaPrettyPrint(myFirstAlignment, output="asis")
@
```

The same example in knitr:

```
<<AnyChunkName,results="asis">>=
msaPrettyPrint(myFirstAlignment, output="asis")
@
```

Note that, for processing the resulting L<sup>A</sup>T<sub>E</sub>X source document, the `TeXshade` package must be installed (see Section 2) and the `TeXshade` package must be loaded in the preamble:

```
\usepackage{texshade}
```

## 7.6 Sequence Names

The `Biostrings` package does not impose any restrictions on the names of sequences. Consequently, `msa` also allows all possible ASCII strings as sequence (row) names in multiple alignments. As soon as `msaPrettyPrint()` is used for pretty-printing multiple sequence alignments, however, the sequence names are interpreted as plain L<sup>A</sup>T<sub>E</sub>X source code. Consequently, L<sup>A</sup>T<sub>E</sub>X errors may arise because of characters or words in the sequence names that L<sup>A</sup>T<sub>E</sub>X does not or cannot interpret as plain text correctly. This particularly includes appearances of special characters and backslash characters in the sequence names.

The `msa` package offers a function `msaCheckNames()` which allows for finding and replacing potentially problematic characters in the sequence names of multiple alignment objects (see `?msaCheckNames`). However, the best solution is to check sequence names carefully and to avoid problematic sequence names from the beginning. Note, moreover, that too long sequence names will lead to less appealing outputs, so users are generally advised to consider sequence names carefully.

## 7.7 Pretty-Printing Wide Alignments

If the alignment to be printed with `msaPrettyPrint()` is wide (thousands of columns or wider), L<sup>A</sup>T<sub>E</sub>X may terminate prematurely because of exceeded T<sub>E</sub>X capacity. Unfortunately, this problem remains opaque to the user, since `texi2dvi()` and `texi2pdf()` do not convey much details about L<sup>A</sup>T<sub>E</sub>X problems when typesetting a document. We recommend the following if a user encounters problems with running `msaPrettyPrint()`'s output with `texi2dvi()` and `texi2pdf()`:

1. Run `pdflatex` on the generated `.tex` file to see whether it is actually a problem with  $\text{\TeX}$  capacity.
2. If so, split the alignment into multiple chunks and run `msaPrettyPrint()` on each chunk separately.

The following example demonstrates this approach for a multiple alignment object ‘aln’:

```
chunkSize <- 300 ## how much fits on one page depends on the length of
## names and the number of sequences;
## change to what suits your needs

for (start in seq(1, ncol(aln), by=chunkSize))
{
  end <- min(start + chunkSize - 1, ncol(aln))
  alnPart <- DNAMultipleAlignment(subseq(unmasked(aln), start, end))

  msaPrettyPrint(x=alnPart, output="pdf", subset=NULL,
                 file=paste0("aln_", start, "-", end, ".pdf"))
}
```

This creates multiple PDF files all of which show one part of the alignment. Please note, however, that the numbering of columns is restarted for each chunk.

## 7.8 Further Caveats

- Note that `texi2dvi()` and `texi2pdf()` always save the resulting DVI/PDF files to the current working directory, even if the  $\text{\LaTeX}$  source file is in a different directory. That is also the reason why the temporary file is created in the current working directory in the example below.
- $\text{\TeX}\text{shade}$  has a wide array of functionalities. Only the most common ones have been tested for interoperability with R. So the use of the arguments `furtherCode` and `code` is the user’s own risk!

# 8 Known Issues

## Memory Leaks

The original implementations of ClustalW, ClustalOmega, and MUSCLE are stand-alone command line programs which are only run once each time a multiple sequence alignment is performed. During the development of the `msa` package, we performed memory management checks using Valgrind [8] and discovered multiple memory leaks in ClustalW and MUSCLE. These memory leaks have no effect for the command line tools, since the program is closed each time the alignment is finished. In the implementation of the `msa` package, however, these memory leaks may have an effect if the same algorithm is run multiple times.

For MUSCLE, we managed to eliminate all memory leaks by deactivating the two parameters `weight1` and `weight2`. ClustalOmega did not show any memory leaks. ClustalW indeed has several memory leaks which are benign if the algorithm is run only a few times, but which may have more severe effects if the algorithm is run many times. ClustalOmega also has a minor memory leak, but the loss of data is so small that no major problems are to be expected except for thousands of executions of ClustalOmega.

### **ClustalOmega vs. Older GCC Versions on Linux/Unix**

We have encountered peculiar behavior of ClustalOmega if the package was built using an older GCC version: if we built the package on an x86\_64 Linux system with GCC 4.4.7, ClustalOmega built smoothly and could be executed without any errors. However, the resulting multiple sequence alignment was more than sub-optimal. We could neither determine the source of this problem nor which GCC versions show this behavior. We therefore recommend Linux/Unix users to use an up-to-date GCC version (we used 4.8.2 during package development, which worked nicely) or, in case they encounter dubious results, to update to a newer GCC version and re-install the package.

### **ClustalOmega: OpenMP Support on Mac OS**

ClustalOmega is implemented to make use of OpenMP (if available on the target platform). Due to issues on one of the Bioconductor build servers running Mac OS, we had to deactivate OpenMP generally for Mac OS platforms. If a Mac OS user wants to re-activate OpenMP, he/she should download the source package tarball, untar it, comment/uncomment the corresponding line in `msa/src/ClustalOmega/msaMakefile` (see first six lines), and build/install the package from source.

### **Build/installation issues**

Some users have reported compiler and linker errors when building `msa` from source on Linux systems. In almost all cases, these could have been tracked down to issues with the R setup on those systems (e.g. a `Rprofile.site` file that makes changes to the R environment that are not compatible with `msa`'s Makefiles).<sup>6</sup> In most cases, these issues can be avoided by installing `msa` in a “vanilla R session”, i.e. starting R with option `--vanilla` when installing `msa`.

## **9 Future Extensions**

We envision the following changes/extensions in future versions of the package:

- Integration of more multiple sequence alignment algorithms, such as, T-Coffee [9] or DI-ALIGN [7]
- Support for retrieving guide trees from the multiple sequence alignment algorithms

---

<sup>6</sup>See, e.g., <https://support.bioconductor.org/p/90735/>

- Interface to methods computing phylogenetic trees (e.g. as contained in the original implementation of ClustalW)
- Elimination of memory leaks described in Section 8 and re-activation of parameters that have been deactivated in order to avoid memory leaks
- More tolerant handling of custom substitution matrices (MUSCLE interface)

## 10 How to Cite This Package

If you use this package for research that is published later, you are kindly asked to cite it as follows:

U. Bodenhofer, E. Bonatesta, C. Horejš-Kainrath, and S. Hochreiter (2015). msa: an R package for multiple sequence alignment. *Bioinformatics* **31**(24):3997–3999. DOI: bioinformatics/btv494.

To obtain a BibTeX entries of the reference, enter the following into your R session:

```
toBibtex(citation("msa"))
```

Moreover, we insist that, any time you cite the package, you also cite the original paper in which the original algorithm has been introduced (see bibliography below).
