1 Introduction

You may have found yourself in a familiar predicament for many bioinformaticians: you have a lot of sequences and you need to downsize before you can get going. You may also theorize that this must be an easy problem to solve —given sequences, output clusters. But what can you utilize to solve this problem? This vignette will familiarize you with the Clusterize function in the DECIPHER package. Clusterize will revolutionize all your clustering needs! Why Clusterize?

- Scalability Clusterize will linearize the search space so that many sequences can be clustered in a reasonable amount of time.
- Simplicity Although you can individual*ize* Clusterize, the defaults are straightforward and should meet most of your needs.
- Accuracy Clusterize will maximize your ability to extract biologically meaningful results from your sequences.

This vignette will summarize the use of Clusterize to cluster DNA, RNA, or protein sequences.

2 Getting Started

To get started we need to load the DECIPHER package, which automatically mobilize a few other required packages.

> library(DECIPHER)

There's no need to memorize the inputs to Clusterize, because its help page can be accessed through:

> ? Clusterize

3 Optimize your inputs to Clusterize

Clusterize requires that you first digitize your sequences by loading them into memory. For the purpose of this vignette, we will capitalize on the fact that DECIPHER already includes some built-in sets of sequences.

```
> # specify the path to your file of sequences:
> fas <- "<<path to training FASTA file>>"
> # OR use the example DNA sequences:
> fas <- system.file("extdata",</pre>
         "50S_ribosomal_protein_L2.fas",
         package="DECIPHER")
> # read the sequences into memory
> dna <- readDNAStringSet(fas)</pre>
> dna

```

The Clusterize algorithm will generalize to nucleotide or protein sequences, so we must choose which we are going to use. Here, we hypothesize that weaker similarities can be detected between proteins and, therefore, decide to use the translated coding (amino acid) sequences. If you wish to cluster at high similarity, you could also strategize that nucleotide sequences would be better because there would be more nucleotide than amino acid differences.

```
> aa <- translate(dna)</pre>
> aa
AAStringSet object of length 317:
      width seq

```

> seqs <- aa # could also cluster the nucleotides

Now you can choose how to parameterize the function, with the main arguments being myXStringSet and cutoff. In this case, we will initialize cutoff at seq(0.5, 0, -0.1) to cluster sequences from 50% to 100% similarity by 10%'s. It is important to recognize that *cutoffs* can be provided in *ascending* or *descending* order and, when *descending*, groups at each *cutoff* will be nested within the previous *cutoff*'s groups.

We must also choose whether to customize the calculation of distance. The defaults will penalize gaps as single events, such that each consecutive set of gaps (i.e., insertion or deletion) is considered equivalent to one mismatch. If you want to standardize the definition of distance to be the same as most other clustering programs then set: *penalizeGapLetterMatches* to TRUE (i.e., every gap position is a mismatch), *method* to "shortest", *minCoverage* to 0, and *includeTerminalGaps* to TRUE. It is possible to rationalize many different measures of distance – see the DistanceMatrix function for more information about alternative parameterizations.

We can further personal*ize* the inputs as desired. The main function argument to emphas*ize* is *processors*, which controls whether the function is parallelized on multiple computer threads (if DECIPHER) was built with OpenMP enabled). Setting *processors* to a value greater than 1 will speed up clustering considerably, especially for large *size* clustering problems. Once we are ready, it's time to run Clusterize and wait for the output to material*ize*!

```
> clusters <- Clusterize(seqs, cutoff=seq(0.5, 0, -0.1), processors=1)</pre>
Partitioning sequences by 6-mer similarity:
iteration 8 of up to 400 (100.0% coverage)
Time difference of 0.04 secs
Sorting by relatedness within 1 group:
iteration 51 of up to 51 (100.0% stability)
Time difference of 1.17 secs
Clustering sequences by 4-mer similarity:
_____
Clusters via relatedness sorting: 100% (0% exclusively)
Clusters via rare 4-mers: 100% (0% exclusively)
Estimated clustering effectiveness: 100%
Time difference of 0.16 secs
> class(clusters)
[1] "data.frame"
> colnames(clusters)
[1] "cluster_0_5" "cluster_0_4" "cluster_0_3" "cluster_0_2" "cluster_0_1"
[6] "cluster_0"
> str(clusters)
'data.frame':
                   317 obs. of 6 variables:
 $ cluster_0_5: int 4 4 4 4 4 4 4 3 3 3 ...
 $ cluster_0_4: int 1 6 6 6 4 4 4 10 10 10 ...
 $ cluster_0_3: int 53 38 38 38 45 45 42 30 30 30 ...
 $ cluster_0_2: int 1 24 24 24 12 12 16 35 35 ...
 $ cluster_0_1: int 87 54 54 54 69 69 64 42 42 42 ...
 $ cluster_0 : int 2 45 45 45 24 24 32 57 57 ...
```

> apply(clus	sters, 2, ma	x) # number	of clusters	per cutoff	
cluster_0_5	cluster_0_4	cluster_0_3	cluster_0_2	cluster_0_1	cluster_0
4	27	53	71	87	102

Notice that Clusterize will characterize the clustering based on how many clustered pairs came from relatedness sorting versus rare k-mers, and Clusterize will predict the effectiveness of clustering. Depending on the input sequences, the percentage of clusters originating from relatedness sorting will equalize with the number originating from rare k-mers, but more commonly clusters will originate from one source or the other. The clustering effectiveness formalizes the concept of "inexact" clustering by approximating the fraction of possible sequence pairs that were correctly clustered together. You can incentivize a higher clustering effectiveness by increasing maxPhase3 at the expense of (proportionally) longer run times.

We can now real*ize* our objective of decreasing the number of sequences. Here, we will priorit*ize* keeping only the longest diverse sequences.

```
> o <- order(clusters[[2]], width(seqs), decreasing=TRUE) # 40% cutoff
> o <- o[!duplicated(clusters[[2]])]</pre>
> aa[0]

4 Visualize the output of Clusterize

We can scrutinize the clusters by selecting them and looking at their multiple sequence alignment:

> t <- table(clusters[[1]]) # select the clusters at a cutoff > t <- sort(t, decreasing=TRUE)									
> head(t)									
4 3 1 2									
153 105 47 12									
<pre>> w <- which(clusters[[1]] == names(t[1]))</pre>									
> AlignSeqs(seqs[w], verbose=FALSE)									
AAStringSet object of length 153:									
width seq	names								
<pre>[1] 287 -MALKNFNPITPSLRELVQVDKTR-KNKRTSKFIVKKRK</pre>	- Rickettsia prowaz

[152] 287 -MPIQKCKPTSPGRRFVEKVVHTR-TNKRTTKMIIRDRRVK	- Acinetobacter sp								
[153] 287 -MALKTFNPTTPGQRQLVMVDRTR-SNKSTNKFILLSRHKRKH	- Bradyrhizobium ja								

It's possible to utilize the heatmap function to view the clustering results.

As can be seen in Figure 1, Clusterize will organize its clusters such that each new cluster is within the previous cluster when *cutoff* is provided in descending order. We can also see that sequences from the same species tend to cluster together, which is an alternative way to systematize sequences without clustering.

- > aligned_seqs <- AlignSeqs(seqs, verbose=FALSE)</pre>
- > d <- DistanceMatrix(aligned_seqs, verbose=FALSE)</pre>
- > tree <- TreeLine(myDistMatrix=d, method="UPGMA", verbose=FALSE)</pre>
- > heatmap(as.matrix(clusters), scale="column", Colv=NA, Rowv=tree)

Figure 1: Visualization of the clustering.

5 Specialize clustering for your goals

The most common use of clustering is to categor*ize* sequences into groups sharing similarity above a threshold and pick one representative sequence per group. These settings empitom*ize* this typical user scenario:

```
> c1 <- Clusterize(dna, cutoff=0.2, invertCenters=TRUE, processors=1)</pre>
Partitioning sequences by 9-mer similarity:
iteration 96 of up to 400 (100.0% coverage)
Time difference of 0.22 secs
Sorting by relatedness within 89 groups:
iteration 37 of up to 37 (100.0% stability)
Time difference of 0.54 secs
Clustering sequences by 9-mer similarity:
_____
Clusters via relatedness sorting: 100% (0% exclusively)
Clusters via rare 6-mers: 100% (0% exclusively)
Estimated clustering effectiveness: 100%
Time difference of 1.2 secs
> w <- which(c1 < 0 & !duplicated(c1))</pre>
> dna[w] # select cluster representatives (negative cluster numbers)
DNAStringSet object of length 78:
    width seq
                                                          names
      822 ATGGGAATACGTAAACTCAAGCC...CATCATTGAGAGAAGGAAAAAG Porphyromonas gin...

[77]
      864 ATGGGCATTCGCGTTTACCGACC...GGGTCGCGGTGGTCGTCAGTCT Thermosynechococc...
      840 ATGGGCATTCGCAAATATCGACC...CAAGACGGCTTCCGGGCGAGGT Gloeobacter viola...
[78]
```

By default, Clusterize will cluster sequences with linkage to the representative sequence in each group, but it is also possible to tell Clusterize to minimize the number of clusters by establishing linkage to any sequence in the cluster (i.e., single-linkage):

> c2 <- Clusterize(dna, cutoff=0.2, singleLinkage=TRUE, processors=1)
Partitioning sequences by 9-mer similarity:
iteration 96 of up to 400 (100.0% coverage)
Time difference of 0.2 secs</pre>

It is possible to synthes*ize* a plot showing a cross tabulation of taxonomy and cluster number. We may ideal*ize* the clustering as matching taxonomic labels (2), but this is not exactly the case.

```
> genus <- sapply(strsplit(names(dna), " "), `[`, 1)
> t <- table(genus, c2[[1]])
> heatmap(sqrt(t), scale="none", Rowv=NA, col=hcl.colors(100))
```

Figure 2: Another visualization of the clustering.

6 Finalize your use of Clusterize

Notably, Clusterize is a stochastic algorithm, meaning it will random*ize* which sequences are selected during pre-sorting. Even though the clusters will typically stabil*ize* with enough iterations, you can set the random number seed (before every run) to guarantee reproducibility of the clusters:

Now you know how to utilize Clusterize to cluster sequences.

7 Session Information

All of the output in this vignette was produced under the following conditions:

- R version 4.3.0 RC (2023-04-13 r84269), x86_64-pc-linux-gnu
- Running under: Ubuntu 22.04.2 LTS

> set.seed(NULL) # reset the seed

- Matrix products: default
- BLAS:/home/biocbuild/bbs-3.17-bioc/R/lib/libRblas.so
- LAPACK: /usr/lib/x86_64-linux-gnu/lapack/liblapack.so.3.10.0
- Base packages: base, datasets, grDevices, graphics, methods, parallel, stats, stats4, utils
- Other packages: BiocGenerics 0.46.0, Biostrings 2.68.0, DECIPHER 2.28.0, GenomeInfoDb 1.36.0, IRanges 2.34.0, RSQLite 2.3.1, S4Vectors 0.38.0, XVector 0.40.0
