<b>5</b>	<code>sessionInfo()</code>	<b>6</b>

## 1 Introduction

Ensembl provides the facility to predict functional consequences of known and unknown variants using the Variant Effect Predictor (VEP). The `ensemblVEP` package wraps Ensembl VEP and returns the results as Robjects or a file on disk. To use this package the Ensembl VEP perl script must be installed in your path. See the package README for details. Downloads: <http://uswest.ensembl.org/info/docs/tools/vep/index.html>  
Complete documentation for runtime options: [http://uswest.ensembl.org/info/docs/tools/vep/script/vep\\_options.html](http://uswest.ensembl.org/info/docs/tools/vep/script/vep_options.html)

To test that Ensembl VEP is properly installed, enter the name of the script from the command line:

`variant_effect_predictor.pl`

## 2 Results as R objects

`> library(ensemblVEP)`

The `ensemblVEP` function can return variant consequences from Ensembl VEP as Robjects (`GRanges` or `VCF`) or write them to a file. The default behavior returns a `GRanges`. Runtime options are stored in a `VEPParam` object and allow a great deal of control over the content and format of the results. See the man pages for more details.

`> ?ensemblVEP`  
`> ?VEPParam`

The default runtime options can be inspected by creating a `VEPParam`.

```
> param <- VEPParam()  
> param  
  
class: VEPParam82  
identifier(0):  
colocatedVariants(0):  
dataformat(0):  
basic(0):  
input(1): species  
cache(3): dir, dir_cache, dir_plugins  
output(1): terms
```

```

filterqc(0):
database(2): host, database
advanced(1): buffer_size
version: 82
scriptPath:

> basic(param)

$verbose
[1] FALSE

$quiet
[1] FALSE

$no_progress
[1] FALSE

$config
character(0)

$everything
[1] FALSE

$fork
numeric(0)

```

Using a vcf file from VariantAnnotation as input, we query Ensembl VEP with the default runtime parameters.

```

> fl <- system.file("extdata", "gl_chr1.vcf", package="VariantAnnotation")
> gr <- ensembleVEP(fl)

```

Consequence data are parsed into the metadata columns of the GRanges. To control the type and amount of data returned see the options in output(VEPParam()).

```

> head(gr, 3)
GRanges object with 3 ranges and 23 metadata columns:

-----
seqinfo: 1 sequence from genome

```

Next we use a vcf of structural variants as input

```
> fl <- system.file("extdata", "structural.vcf", package="VariantAnnotation")
```

and request that a VCF object be returned by setting the *vcf* option in the *dataformat* slot to TRUE.

```
> param <- VEPPParam(dataformat=c(vcf=TRUE))
```

An call to ensemblVEP results in an error.

```
> vcf <- ensemblVEP(f1, param)
```

```
2012-12-03 16:40:55 - Starting...
```

```
ERROR: Could not detect input file format
```

In most situations Ensembl VEP can auto-detect the input format. In this case, however, it cannot so we explicitly set the *format* option to 'vcf'.

```
> input(param)$format <- "vcf"
```

Try again.

```
> vep <- ensemblVEP(f1, param)
```

Success! When a VCF is returned, consequence data are included as an unparsed INFO column labeled *CSQ*.

```
> info(vep)$CSQ
```

```
CharacterList of length 5
[[1]] deletion|intron_variant&non_coding_transcript_variant&feature_truncatio...
[[2]] -|intergenic_variant|||||||||||||||||||
[[3]] insertion|upstream_gene_variant|MODIFIER|SETD5|ENSG00000168137|Transcri...
[[4]] duplication|transcript_amplification|HIGH|CRIP1P1|ENSG00000233252|Trans...
[[5]] -|intergenic_variant|||||||||||||||||||
```

The *parseCSQToGRanges* function parses these data into a GRanges. When the rownames of the original VCF are provided as *VCFRowID* a metadata column of the same name is included in the output.

```
> vcf <- readVcf(f1, "hg19")
> csq <- parseCSQToGRanges(vep, VCFRowID=rownames(vcf))
> head(csq, 3)
```

GRanges object with 3 ranges and 24 metadata columns:

### 3 Write results to a file

In the previous section we saw Ensembl VEP results returned as R objects in the workspace. Alternatively, these results can be written directly to a file. The flag that controls how the data are returned is the *output\_file* flag in the *input* options.

When *output\_file* is an empty character (default), the results are returned as either a *GRanges* or *VCF* object.

```

> input(param)$output_file
character(0)

```

To write results directly to a file, specify a file name for the *output\_file* flag.

```
> input(param)$output_file <- "/mypath/myfile"
```

The file can be written as a *vcf* or *gvf* by setting the options in the *dataformat* slot to TRUE. If neither of *vcf* or *gvf* are TRUE the file is written out as tab delimited.

```

> ## Write a vcf file to myfile.vcf:
> myparam <- VEPParam(dataformat=c(vcf=TRUE),
+                      input=c(output_file="/path/myfile.vcf"))
> ## Write a gvf file to myfile.gvf:
> myparam <- VEPParam(dataformat=c(gvf=TRUE),
+                      input=c(output_file="/path/myfile.gvf"))
> ## Write a tab delimited file to myfile.txt:
> myparam <- VEPParam(input=c(output_file="/path/myfile.txt"))

```

### 4 Configuring runtime options

The Ensembl VEP web page has complete descriptions of all runtime options. [http://uswest.ensembl.org/info/docs/tools/vep/script/vep\\_options.html](http://uswest.ensembl.org/info/docs/tools/vep/script/vep_options.html) Below are examples of how to configure the runtime options in the *VEPParam* for specific situations. Investigate the differences in results using a sample file from *VariantAnnotation*.

```
> fl <- system.file("extdata", "ex2.vcf", package="VariantAnnotation")
```

- Add regulatory region consequences:

```

> param <- VEPParam(output=c(regulatory=TRUE))
> gr <- ensemblVEP(fl, param)

```

- Specify input file format as VCF, add HGNC gene identifiers, output SO consequence terms:

```

> param <- VEPParam(input=c(format="vcf"),
+                      output=c(terms="so"),
+                      identifiers=c(symbol=TRUE))
> gr <- ensemblVEP(fl, param)

```

- Check for co-located variants, output only coding sequence consequences, output HGVS names:

```

> param <- VEPParam(filterqc=c(coding_only=TRUE),
+                      colocatedVariants=c(check_existing=TRUE),
+                      identifiers=c(symbol=TRUE))
> gr <- ensemblVEP(fl, param)

```

- Add SIFT score and prediction, PolyPhen prediction only, output results as VCF:

```
f1 <- system.file("extdata", "chr22.vcf.gz", package="VariantAnnotation")
param <- VEPParam(output=c(sift="b", polyphen="p"),
                   dataformat=c(vcf=TRUE))
vcf <- ensemblVEP(f1, param)
csq <- parseCSQToGRanges(vcf)

> head(levels(mcols(csq)$SIFT))
[1] "deleterious(0.01)" "deleterious(0.02)" "deleterious(0.03)"
[4] "deleterious(0.04)" "deleterious(0.05)" "deleterious(0)"

> levels(mcols(csq)$PolyPhen)
[1] "benign"           "possibly_damaging" "probably_damaging"
[4] "unknown"
```

## 5 sessionInfo()

```
> sessionInfo()
