

Package ‘selectKSigs’

July 10, 2025

Type Package

Title Selecting the number of mutational signatures using a perplexity-based measure and cross-validation

Depends R(>= 3.6)

Imports HiLDA, magrittr, gtools, methods, Rcpp

Suggests knitr, rmarkdown, testthat, BiocStyle, ggplot2, dplyr, tidyverse

Version 1.20.0

Date 2021-10-18

Description A package to suggest the number of mutational signatures in a collection of somatic mutations using calculating the cross-validated perplexity score.

calcPMSLikelihood	<i>A function for calculating the log-likelihood from the data and parameters</i>
-------------------	---

Description

A function for calculating the log-likelihood from the data and parameters

Usage

```
calcPMSLikelihood(p, y)
```

Arguments

- p this variable includes the parameters for mutation signatures and membership parameters
- y this variable includes the information on the mutation features, the number of mutation signatures specified and so on

Value

a value

Calculate_Likelihood_test

Output the maximum potential scale reduction statistic of all parameters estimated

Description

Output the maximum potential scale reduction statistic of all parameters estimated

Usage

```
Calculate_Likelihood_test(train, test, paramG)
```

Arguments

train	a MutationFeatureData S4 class output of training data.
test	a MutationFeatureData S4 class output of test data.
paramG	an estimatedParameters S4 class with estimated parameters

Value

the likelihood of the test data

convertFromTurbo_F

Restore the converted parameter F for turboEM

Description

Restore the converted parameter F for turboEM

Usage

```
convertFromTurbo_F(turboF, fdim, signatureNum, isBackground)
```

Arguments

turboF	F (converted for turboEM)
fdim	a vector specifying the number of possible values for each mutation signature
signatureNum	the number of mutation signatures
isBackground	the logical value showing whether a background mutation features is included or not

Value

a vector

convertFromTurbo_Q *Restore the converted parameter Q for turboEM*

Description

Restore the converted parameter Q for turboEM

Usage

```
convertFromTurbo_Q(turboQ, signatureNum, sampleNum)
```

Arguments

turboQ	Q (converted for turboEM)
signatureNum	the number of mutation signatures
sampleNum	the number of cancer genomes

Value

a vector

convertToTurbo_F *Convert the parameter F so that turboEM can treat*

Description

Convert the parameter F so that turboEM can treat

Usage

```
convertToTurbo_F(vF, fdim, signatureNum, isBackground)
```

Arguments

vF	F (converted to a vector)
fdim	a vector specifying the number of possible values for each mutation signature
signatureNum	the number of mutation signatures
isBackground	the logical value showing whether a background mutation features is included or not

Value

a vector

convertToTurbo_Q	<i>Convert the parameter Q so that turboEM can treat</i>
------------------	--

Description

Convert the parameter Q so that turboEM can treat

Usage

```
convertToTurbo_Q(vQ, signatureNum, sampleNum)
```

Arguments

vQ	Q (converted to a vector)
signatureNum	the number of mutation signatures
sampleNum	the number of cancer genomes

Value

a vector

cv_PMSignature	<i>Output the maximum potential scale reduction statistic of all parameters estimated</i>
----------------	---

Description

Output the maximum potential scale reduction statistic of all parameters estimated

Usage

```
cv_PMSignature(inputG, Kfold = 3, nRep = 3, Klmit = 8)
```

Arguments

inputG	a MutationFeatureData S4 class.
Kfold	an integer number of the number of cross-validation folds.
nRep	an integer number of replications.
Klmit	an integer of the maximum value of number of signatures.

Value

a matrix of measures

Examples

```
load(system.file("extdata/sample.rdata", package = "selectKSigs"))
results <- cv_PMSignature(G, Kfold = 3)
```

getBG

*Get the status of using the background signature***Description**

Get the status of using the background signature

Usage

```
getBG(object)
```

Arguments

object	the EstimatedParameters class (the result of pmgetSignature)
--------	--

Value

the status of using the background signature

getCounts

*Get the count data in a matrix***Description**

Get the count data in a matrix

Usage

```
getCounts(object)
```

Arguments

object	the MutationFeatureData class
--------	-------------------------------

Value

the count data in a matrix

<i>getExposures</i>	<i>Get a matrix of mutational exposures of signatures</i>
---------------------	---

Description

Get a matrix of mutational exposures of signatures

Usage

```
getExposures(object)
```

Arguments

object the EstimatedParameters class (the result of pmgetSignature)

Value

a matrix of mutational exposures of signatures

<i>getFeatures</i>	<i>Get a vector of possible features</i>
--------------------	--

Description

Get a vector of possible features

Usage

```
getFeatures(object)
```

Arguments

object the EstimatedParameters class (the result of pmgetSignature)

Value

a vector of possible features

getFeatureVec	<i>Get a matrix of feature vector list</i>
---------------	--

Description

Get a matrix of feature vector list

Usage

```
getFeatureVec(object)
```

Arguments

object the MutationFeatureData class

Value

a matrix of feature vector list

getK	<i>Get the number of signatures</i>
------	-------------------------------------

Description

Get the number of signatures

Usage

```
getK(object)
```

Arguments

object the EstimatedParameters class (the result of pmgetSignature)

Value

the number of signatures in pmgetSignature in HiLDA

getLL	<i>Get the values of loglikelihood</i>
-------	--

Description

Get the values of loglikelihood

Usage

```
getLL(object)
```

Arguments

object	the EstimatedParameters class (the result of pmgetSignature)
--------	--

Value

likelihood values estimated by pmgetSignature in HiLDA

getLogLikelihoodC	<i>Calculate the value of the log-likelihood for given parameters</i>
-------------------	---

Description

Calculate the value of the log-likelihood for given parameters

Usage

```
getLogLikelihoodC(  
    vPatternList,  
    vSparseCount,  
    vF,  
    vQ,  
    fdim,  
    signatureNum,  
    sampleNum,  
    patternNum,  
    samplePatternNum,  
    isBackground,  
    vF0  
)
```

Arguments

<code>vPatternList</code>	The list of possible mutation features (converted to a vector)
<code>vSparseCount</code>	The table showing (mutation feature, sample, the number of mutation) (converted to a vector)
<code>vF</code>	<code>F</code> (converted to a vector)
<code>vQ</code>	<code>Q</code> (converted to a vector)
<code>fdim</code>	a vector specifying the number of possible values for each mutation signature
<code>signatureNum</code>	the number of mutation signatures
<code>sampleNum</code>	the number of cancer genomes
<code>patternNum</code>	the number of possible combinations of all the mutation features
<code>samplePatternNum</code>	the number of possible combination of samples and mutation patterns
<code>isBackground</code>	the logical value showing whether a background mutation features is included or not
<code>vF0</code>	a background mutation features

Value

a value

`getSamplelist`

Get the sample list

Description

Get the sample list

Usage

`getSamplelist(object)`

Arguments

<code>object</code>	the EstimatedParameters class (the result of pmgetSignature)
---------------------	--

Value

the sample list of named elements.

getSamplelistG	<i>Get the sample list</i>
----------------	----------------------------

Description

Get the sample list

Usage

```
getSamplelistG(object)
```

Arguments

object the MutationFeatureData class

Value

the sample list of named elements.

getSignatures	<i>Get an array of signature feature distributions</i>
---------------	--

Description

Get an array of signature feature distributions

Usage

```
getSignatures(object)
```

Arguments

object the EstimatedParameters class (the result of pmgetSignature)

Value

an array of signature feature distributions

`getTranscription` *Get the status of specifying the transcription bias*

Description

Get the status of specifying the transcription bias

Usage

```
getTranscription(object)
```

Arguments

<code>object</code>	the MutationFeatureData class
---------------------	-------------------------------

Value

the status of specifying the transcription bias

`select_kth_fold` *Output the training data or test data*

Description

Output the training data or test data

Usage

```
select_kth_fold(inputG, k, f_s, folds, include)
```

Arguments

<code>inputG</code>	a MutationFeatureData S4 class output by the pmsignature.
<code>k</code>	an integer number of the number of cross-validation folds.
<code>f_s</code>	a primary key of combining the feature pattern and sample ID.
<code>folds</code>	the assignment to each fold.
<code>include</code>	a boolean indicator of whether to include kth fold or not.

Value

a MutationFeatureData S4 class of either include or exclude kth fold.

splitG	<i>Output the maximum potential scale reduction statistic of all parameters estimated</i>
--------	---

Description

Output the maximum potential scale reduction statistic of all parameters estimated

Usage

```
splitG(inputG, Kfold = 3)
```

Arguments

inputG	a MutationFeatureData S4 class output by the pmsignature.
Kfold	an integer number of the number of cross-validation folds.

Value

a matrix made of perplexity from the results of cross-validation.

Examples

```
load(system.file("extdata/sample.rdata", package = "selectKSigs"))
G_split <- splitG(G, Kfold = 3)
```
