

Package ‘ImageArray’

May 4, 2026

Type Package

Title A framework for on-disk and in-memory image arrays

Version 1.1.0

Date 2026-01-20

Description ImageArray provides a framework for on-disk and in-memory image arrays, specifically for pyramidal images stored in HDF5, Zarr and life sciences image file formats (OME Bio-Formats).

License MIT + file LICENSE

Encoding UTF-8

RoxygenNote 7.3.3

biocViews Software, Visualization

Depends R (>= 4.5.0), EBImage

Imports methods, grDevices, S4Arrays, S4Vectors, DelayedArray, rhdf5, HDF5Array, Rarr, ZarrArray, magick, tools

Suggests testthat (>= 3.0.0), knitr, ggplot2, shiny, RBioFormats, BiocFileCache, BiocStyle

Config/testthat/edition 3

| | |
|-----------------|-----------------------------------|
| BFArray-methods | <i>BFArray constructor method</i> |
|-----------------|-----------------------------------|

Description

A function for creating objects of BFArray class

Usage

```
BFArray(image.file, series, resolution)
```

```
## S4 method for signature 'BFArraySeed'
dim(x)
```

```
## S4 method for signature 'BFArraySeed'
type(x)
```

Arguments

| | |
|-------------------------|---|
| <code>image.file</code> | the path to the image read by RBioFormats |
| <code>series</code> | the series IDs of the pyramidal image, typical an integer starting from 1 |
| <code>resolution</code> | the resolution IDs of the pyramidal image, typical an integer starting from 1 |
| <code>x</code> | A BFArray object |

Value

A BFArray object

Functions

- `dim(BFArraySeed)`: dim function for BFArray objects
- `type(BFArraySeed)`: type function for BFArray objects

Examples

```
# get image
library(RBioFormats)
img.file <- system.file("extdata",
                        "xy_12bit__plant.ome.tiff",
                        package = "ImageArray")
bfa <- BFAArray(img.file, series = 1, resolution = 2)
dim(bfa)
type(bfa)
```

| | |
|------------------|-------------------------|
| createImageArray | <i>createImageArray</i> |
|------------------|-------------------------|

Description

creates an object of ImageArray class

Usage

```
createImageArray(
  image,
  n.levels = NULL,
  series = NULL,
  resolution = NULL,
  max.pixel.threshold = 700,
  engine = "EBImage",
  verbose = FALSE
)
```

Arguments

| | | |
|---------------------|--|--|
| image | the image | |
| n.levels | the number of levels of the pyramidal image, typical an integer starting from 1 | |
| series | the series IDs of the pyramidal image, typical an integer starting from 1. | |
| resolution | the resolution IDs of the pyramidal image, typical an integer starting from 1. | |
| max.pixel.threshold | the maximum width and height pixel dimension that the lowest level of the image pyramid should have, thus the image will be downscaled two folds until both width and height is below the threshold. Default is 700 pixels. If n.levels is provided, this parameter will be ignored. | |
| engine | the package to use for each image layer: either EBImage or magick-image | |
| verbose | verbose | |

Value

An ImageArray object

Examples

```
# get image
library(EBImage)
img.file <- system.file("images", "sample.png", package="EBImage")

# create ImageArray
imgarray <- createImageArray(img.file, n.levels = 3)
imgarray_raster <- as.raster(imgarray, max.pixel.size = 300)
plot(imgarray_raster)
```

| | |
|-------------|--------------------|
| create_zarr | <i>create_zarr</i> |
|-------------|--------------------|

Description

Create zarr store

Usage

```
create_zarr(store, version = "v2")
```

Arguments

| | |
|---------|----------------------------|
| store | the location of zarr store |
| version | zarr version |

Value

'NULL'

Examples

```
store <- tempfile(fileext = ".zarr")
create_zarr(store)
```

| | |
|-------------------|--------------------------|
| create_zarr_group | <i>create_zarr_group</i> |
|-------------------|--------------------------|

Description

Create a zarr group

Usage

```
create_zarr_group(store, name, version = "v2")
```

Arguments

| | |
|---------|------------------------------|
| store | the location of (zarr) store |
| name | name of the group |
| version | zarr version |

Value

‘NULL‘

Examples

```
store <- tempfile(fileext = ".zarr")
create_zarr(store)
create_zarr_group(store, "gp")
```

| | |
|---------------------------|---------------------|
| <code>getImageInfo</code> | <i>getImageInfo</i> |
|---------------------------|---------------------|

Description

get information of an ImageArray object

Usage

```
getImageInfo(object)
```

Arguments

| | |
|--------|----------------------|
| object | an ImageArray object |
|--------|----------------------|

Value

a data frame of width and height info

Examples

```
# get image
library(EBImage)
img.file <- system.file("images", "sample.png", package="EBImage")

# create ImageArray
dir.create(td <- tempfile())
output_h5 <- tempfile(fileext = ".h5")
imgarray <- writeImageArray(img.file,
                            output = output_h5,
                            name = "image",
                            verbose = FALSE)

getImageInfo(imgarray)

# create ImageArray
imgarray <- createImageArray(img.file, n.levels = 3)
imgarray_raster <- as.raster(imgarray, max.pixel.size = 300)
getImageInfo(imgarray)
```

Description

Methods for ImageArray objects

Usage

```
## S4 method for signature 'ImageArray,ANY,ANY,ANY'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'ImageArray,numeric'
x[[i]]

## S4 replacement method for signature 'ImageArray,numeric'
x[[i, j, ...]] <- value

## S4 method for signature 'ImageArray'
dim(x)

## S4 method for signature 'ImageArray'
type(x)

## S4 method for signature 'ImageArray'
length(x)

ImageArray(meta, levels)

## S4 method for signature 'ImageArray'
realize(x, level = NULL, max.pixel.size = NULL, min.pixel.size = NULL)

## S3 method for class 'ImageArray'
as.raster(x, level = NULL, max.pixel.size = NULL, min.pixel.size = NULL, ...)

## S4 method for signature 'ImageArray'
rotate(x, angle)

## S4 method for signature 'ImageArray'
aperm(a, perm)

## S4 method for signature 'ImageArray'
negate(object)

## S4 method for signature 'ImageArray'
modulate(object, brightness)

## S4 method for signature 'ImageArray'
flip(x)

## S4 method for signature 'ImageArray'
```

```
flop(x)

## S4 method for signature 'ImageArray'
crop(object, index)

## S4 method for signature 'ImageArray'
axes(object)

## S4 method for signature 'ImageArray'
meta(object)

## S4 method for signature 'ImageArray'
path(object)

## S4 replacement method for signature 'ImageArray'
path(object) <- value
```

Arguments

| | |
|----------------|--|
| x, a, object | An ImageArray object |
| i, j, value | Depends on the usage [[, [[<- Here i is the level of the image pyramid. You can use the length function to get the number of the layers in the pyramid. When used with crop, arguments i and j are associated with indices of image dimensions (e.g. width, height) |
| ... | Arguments passed to other methods |
| drop | ignored |
| meta | the metadata of the ImageArray object. |
| levels | levels of the pyramid image, typically a vector of integers starting with 1 |
| level | level |
| max.pixel.size | maximum pixel size |
| min.pixel.size | minimum pixel size |
| angle | value between 0 and 360 for degrees to rotate |
| perm | perm |
| brightness | the brightness of the new image in percentage, e.g. 120 |
| index | a named or unnamed list of indices for cropping/subsetting the |

Value

dim of the first level of the ImageArray object
 type of ImageArray object
 length of ImageArray object
 An ImageArray object

Functions

- `x[i]`: subset and crop for ImageArray objects
- `x[[i]`: Layer access for ImageArray objects
- ``[[` (x = ImageArray, i = numeric) <- value`: Layer access for ImageArray objects
- `dim(ImageArray)`: dimensions of an ImageArray
- `type(ImageArray)`: dimensions of an ImageArray
- `length(ImageArray)`: length of an ImageArray
- `ImageArray()`: ImageArray constructor method
A function for creating objects of ImageArray class
- `realize(ImageArray)`: realize the array
- `as.raster(ImageArray)`: create a raster object
- `rotate(ImageArray)`: rotate image array to 90, 180, 270 degrees
- `aperm(ImageArray)`: permute image
- `negate(ImageArray)`: negate image
- `modulate(ImageArray)`: modulate image
- `flip(ImageArray)`: vertical flipping image
- `flop(ImageArray)`: horizontal flipping image
- `crop(ImageArray)`: cropping image
- `axes(ImageArray)`: get axes metadata of the ImageArray object
- `meta(ImageArray)`: get metadata of the ImageArray object
- `path(ImageArray)`: path of an ImageArray object
- `path(ImageArray) <- value`: replace method for `path(ImageArray)`

Examples

```
# get image
library(EBImage)
img.file <- system.file("images", "sample.png", package="EBImage")

# create ImageArray
imgarray <- createImageArray(img.file, n.levels = 3)

# access layers
imgarray[[1]]
imgarray[[2]]

# dimensions and length
dim(imgarray)
length(imgarray)

# manipulate images
imgarray <- crop(imgarray, ind = list(100:200, 100:200))
imgarray <- crop(imgarray, ind = list(x = 10:20, y = 10:20))
imgarray <- rotate(imgarray, angle = 90)
imgarray <- flip(imgarray)
imgarray <- flop(imgarray)

# create ImageArray on disk as HDF5 format
```

```

dir.create(td <- tempfile())
output_h5 <- tempfile(fileext = ".h5")
imgarray <- writeImageArray(img.file,
                           output = output_h5,
                           name = "image",
                           verbose = FALSE)

# as.raster
imgarray_raster <- as.raster(imgarray)

# realize
imgarray <- realize(imgarray)

```

| | |
|-----------------|------------------------|
| writeImageArray | <i>writeImageArray</i> |
|-----------------|------------------------|

Description

Writing image arrays on disk

Usage

```

writeImageArray(
  image,
  output = "my_image",
  name = "",
  format = NULL,
  replace = FALSE,
  n.levels = NULL,
  chunkdim = NULL,
  level = NULL,
  engine = "EBImage",
  verbose = FALSE,
  ...
)

```

Arguments

| | |
|----------|---|
| image | an Image object (EBImage), a magick object or the path to an image file, |
| output | output file name |
| name | name of the group |
| format | on disk format, either "h5" for HDF5 format, "zarr" for zarr format, or "in-memory" for in-memory ImageArray object. If not provided, the format will be inferred from the file extension of the output path. |
| replace | Should the existing file be removed or not |
| n.levels | the number of levels if the image supposed to be pyramidal. |
| chunkdim | The dimensions of the chunks to use for writing the data to disk. |
| level | The compression level to use for writing the data to disk. |
| engine | the package to use for each image layer: either EBImage or magick-image |
| verbose | verbose |
| ... | additional parameters passed to createImageArray . |

Value

An ImageArray object

Examples

```
# get image
library(EBImage)
img.file <- system.file("images", "sample.png", package="EBImage")

# create ImageArray
dir.create(td <- tempfile())
output_h5 <- tempfile(fileext = ".h5")
imgarray <- writeImageArray(img.file,
                             output = output_h5,
                             name = "image",
                             verbose = FALSE)
imgarray_raster <- as.raster(imgarray)
plot(imgarray_raster)
```
