

# Package ‘IVAS’

April 14, 2017

**Type** Package

**Title** Identification of genetic Variants affecting Alternative Splicing

**Version** 1.6.0

**Author** Seonggyun Han, Sangsoo Kim

**Maintainer** Seonggyun Han <hangost@ssu.ac.kr>

**Description** Identification of genetic variants affecting alternative splicing.

**License** GPL-2

**Depends** R (> 3.0.0), GenomicFeatures

**Imports** doParallel, lme4, Matrix, BiocGenerics, GenomicRanges, IRanges, foreach, AnnotationDbi, S4Vectors, GenomeInfoDb

**Suggests** BiocStyle

**biocViews** AlternativeSplicing, DifferentialExpression, DifferentialSplicing, GeneExpression, GeneRegulation, Regression, RNASeq, Sequencing, SNP, Software, Transcription

**NeedsCompilation** no

IVAS-package

*IVAS : Identification of genomic variants affecting Alternative Splicing***Description**

The tool is to detect genomic variants affecting the alternative splicing using genotypic and gene expression data(RNA-seq).

calSignificant

*Calculates P.values by using two statistical models.***Description**

calculates P.values for association between expressions and genotypes by using the linear regression model and/or generalized linear mixed model.

**Usage**

```
calSignificant(tx.gene=NULL, total.locus=NULL, exon.locus=NULL, intron.locus=NULL,
info.strand=NULL, overapvalue=NULL, chrnum=NULL, expdata=NULL, snpdata=NULL, method=NULL)
```

**Arguments**

<code>tx.gene</code>	The matrix of transcripts including transcript IDs, Ensembl gene names, Ensembl transcript names, transcript start sites, and transcript end sites.
<code>total.locus</code>	Ranges including alternative exons and flanking introns in a gene.
<code>exon.locus</code>	All exon locus of a single gene.
<code>intron.locus</code>	All intron locus of a single gene.
<code>info.strand</code>	The strand information of a single gene (forward strand = "+", reverse strand = "-").
<code>overapvalue</code>	Snps located in the alternative exons and the flanking introns
<code>chrnum</code>	The chromosome number of a single gene.
<code>expdata</code>	Dataframe of expression data.
<code>snpdata</code>	Datafame of genotype data.
<code>method</code>	The option for statistical models and boxplot.( <code>"lm"</code> : analysis using linear regression model, <code>"glm"</code> : analysis using generalized linear mixed model, <code>"both"</code> : <code>"lm"</code> and <code>"glm"</code> , and <code>"boxplot"</code> : for writing boxplot).

**Value**

The `lm` or `glm` method returns matrix including; SNP marker IDs, Chromosome numbers, alternative exons ranges, Intron ranges, alternative types, P values, information of differential median values of expression ratio among genotypes ("sig" if differential median > 0.1 and "not sig" otherwise), gene names, and methods ("`lm`" or "`glm`"). The `boxplot` method returns matrix with relative ratio values and genotypes of samples.

---

chrseparate

*Separate a TranscriptDb object based on a chromosome.*

---

**Description**

With the isActiveSeq method in GenomicFeatures package, this function filters the transcriptDb object in the GenomicFeatures package based on a single chromosome.

**Usage**

```
chrseparate(transdb = NULL, chrname = NULL)
```

**Arguments**

transdb	The transcriptDb object in the GnomicFeatures package.
chrname	The chromosome number you would like to selecet from TrnascriptDb

**Value**

This function returns the TrnascriptDb limited to the chromosome number that you want.

**Author(s)**

Seonggyun Han, Sangsoo Kim

**References**

**See Also**

[isActiveSeq](#), [seqinfo](#)

**Examples**

```
sampleDB <- system.file("extdata", "sampleDB", package="IVAS")
sample.Txdb <- loadDb(sampleDB)
filtered.txdb <- chrseparate(sample.Txdb,19)
```

**findAlternative**      *Find alternative exons of a gene.*

## Description

Search alternative exons among transcript isoforms from a single gene.

## Usage

```
findAlternative(geneid = NULL, txTable = NULL, totalExrange = NULL,
totalInrange = NULL, one.chr = NULL)
```

## Arguments

geneid	Ensembl gene name.
txTable	The matrix of transcripts including transcript IDs, Ensembl gene names, Ensembl transcript names, transcript start sites, and transcript end sites.
totalExrange	A list of GRanges objects inclucing total exon ranges in each transcript resulted from the exonsBy function in GenomicFeatures.
totalInrange	A list of GRanges objects inclucing total intron ranges in each transcript resulted from the intronsByTranscript function in GenomicFeatures.
one.chr	The chromosome number that you want.

## Value

alterIntron	A GRanges object with flanking introns of alternative exons
tableBygene	An information table of transcripts including transcript IDs, Ensembl gene names, Ensembl transcript names, transcript start sites, and transcript end sites.
exonRange	All exons locus of a gene
intronRange	All intron locus of a gene

## Examples

```
sampleDB <- system.file("extdata", "sampleDB", package="IVAS")
sample.Txdb <- loadDb(sampleDB)
filtered.Txdb <- chrseparate(sample.Txdb,19)
trans.exon.range <- exonsBy(filtered.Txdb,by="tx")
trans.intron.range <- intronsByTranscript(filtered.Txdb)
txTable <- select(filtered.Txdb, keys=names(trans.exon.range),
columns=c("TXID","TXNAME","GENEID","TXSTART","TXEND"), keytype="TXID")
Altvalue <- findAlternative("ENSG00000170889",txTable,trans.exon.range,trans.intron.range,19)
```

**findOversnp**

*Find SNPs which belongs to alternative exons and flanking introns of them.*

## Description

Find SNPs which belong to alternative exons and flanking introns of them.

## Usage

```
findOversnp(altInvalue = NULL, snprange = NULL)
```

## Arguments

- |            |  |
|------------|--|
| altInvalue | A list data set from the findAlternative function. |
| snprange   | A matrix of SNP ranges.                            |

## Value

This function returns a matrix with SNPs in alternative exons and flanking introns and ranges of those SNPs.

**MsqtlFinder***Find SQTLs in multiple genes.***Description**

This function enables one to analyze multiple genes using multi-thread version of the foreach function and joins output results from sqtlfinder function. Moreover, it calculates the FDR using P-values of the matrix result data.

**Usage**

```
MsqtlFinder(expdata = NULL, snpdata = NULL, snplocus = NULL, GTFdata = NULL,
met = NULL, Ncor = 1, bplotout = NULL, cutFDR = 0.01)
```

**Arguments**

expdata	Dataframe of expression data.
snpdata	Dataframe of genotype data.
snplocus	Locus of SNP markers in the snpdata.
GTFdata	The transcriptDb object in the GnomicFeatures package.
met	The option for statistical models."lm" : analysis using linear regression model, "glm" : analysis using generalized linear mixed model, and "both" : "lm" and "glm").
Ncor	The number of cores for multi-threads.
bplotout	A directory saving boxplots
cutFDR	The false discovery rate value you would like to set threshold.

**Value**

This function returns the result matrix including SNP markers ID, chromosome number, alternative exons range, intron ranges, alternative type, P value, information of differential median values of expression ratio among genotypes ("sig" if differential median > 0.1 and "not sig" otherwise), gene names, methods ("lm" or "glm").

data(samplesnp)
data(samplesnplocus)
#final.result <- MsqtlFinder(sampleexp,samplesnp,samplesnplocus,sample.Txdb,"1m",1)
```

---

sampleexp

*CEU expression data*

---

**Description**

CEU expression data including 78 individuals

**Usage**

```
data("sampleexp")
```

**Format**

A data frame with 64 transcript expressions on the 78 individuals

**Value**

A data frame with 64 transcript expressions on the 78 individuals

**Source**

The data was generated by GEUVADIS (Genetic European Variation in Health and Disease, A European Medical Sequencing Consortium) RNA sequencing project for 1000 Genomes samples (<http://www.geuvadis.org/web/geuvadis/RNAseq-project>).

**Examples**

```
data(sampleexp)
```

---

samplesnp	<i>CEU genotype data</i>
-----------	--------------------------

---

### Description

CEU genotype data including 78 individuals

### Usage

```
data("samplesnp")
```

### Format

A data frame with 11 SNPs on the 78 individuals

### Value

A data frame with 11 SNPs on the 78 individuals

### Source

The data has 1000 genomes Phages 1 dataset and was imputed by GEUVADIS (Genetic European Variation in Health and Disease, A European Medical Sequencing Consortium) RNA sequencing project for 1000 Genomes samples (<http://www.geuvadis.org/web/geuvadis/RNAseq-project>).

### References

### Examples

```
data(samplesnp)
```

---

samplesnplocus	<i>snplocus</i>
----------------	-----------------

---

### Description

snplocus

### Usage

```
data("samplesnplocus")
```

### Format

A data frame with 11 SNPs and locus of them

**Value**

A data frame with 11 SNPs and locus of them

**Examples**

```
data(samplesnplocus)
```

---

saveBplot

*Save boxplots*

---

**Description**

Save boxplots

**Usage**

```
saveBplot(sig.sqtl = NULL, expdata = NULL, snpdata = NULL,  
snplocus = NULL, GTFdata = NULL, outdir = NULL)
```

**Arguments**

sig.sqtl	A matrix of significant SQTLs from the sqtlfinder function
expdata	Dataframe of expression data.
snpdata	Dataframe of genotype data.
snplocus	Locus of SNP markers in the snpdata.
GTFdata	The transcriptDb object in the GnomicFeatures package.
outdir	A directory saving boxplots

**Value**

This function draws the boxplot

**Author(s)**

## Examples

```

sampleDB <- system.file("extdata", "sampleDB", package="IVAS")
sample.Txdb <- loadDb(sampleDB)
data(samplesnplocus)
data(sampleexp)
data(samplesnp)
filtered.txdb <- chrseparate(sample.Txdb,19)
trans.exon.range <- exonsBy(filtered.txdb,by="tx")
trans.intron.range <- intronsByTranscript(filtered.txdb)
txTable <- select(filtered.txdb, keys=names(trans.exon.range),
columns=c("TXID","TXNAME","GENEID","TXSTART","TXEND"), keytype="TXID")
ch.snp.locus <- as.matrix(samplesnplocus[samplesnplocus[,2] == 19,])
ch.snps <- matrix(ch.snp.locus[is.element(ch.snp.locus[,1],rownames(samplesnp)),],ncol=3,byrow=FALSE)
ch.snps.range <- GRanges(seqnames=Rle(19),ranges=IRanges(start=as.integer(ch.snps[,3]),
end=as.integer(ch.snps[,3])),metadata=ch.snps[,1])
Altvalue <- findAlternative("ENSG0000170889",txTable,trans.exon.range,trans.intron.range,19)
overlapsnp <- findOversnp(Altvalue,ch.snps.range)
sqtl.result <- sqtlfinder(Altvalue,overlapsnp,sampleexp,samplesnp,"lm")
saveBplot(sqtl.result,sampleexp,samplesnp,samplesnplocus,filtered.txdb,"./result")

```

**sqtlfinder**

*Find SQTLs.*

## Description

Find significant SNPs using the calSignificant function.

## Usage

```
sqtlfinder(altInvalue = NULL, overapvalue = NULL, expdata = NULL, snpdata = NULL, method = NULL)
```

## Arguments

altInvalue	A list data set from the findAlternative function.
overapvalue	A matrix data with SNPs in the flanking introns of alternative exons and ranges of those SNPs from findOversnp function.
expdata	Expression data of samples.
snpdata	Genotype data of samples.
method	The option for statistical models and boxplot."lm" : analysis using linear regression model, "glm" : analysis using generalized linear mixed model, "both" : "lm" and "glm",and "boxplot" : for writing boxplot).

## Value

The lm or glm method returns matrix data including SNP markers ID, chromosome number, alternative exons range, intron ranges, alternative type, P value, information of differential median values of expression ratio among genotypes ("sig" if differential median > 0.1 and "not sig" otherwise), a gene name, methods ("lm" or "glm"),and strand information of the gene. The boxplot method returns matrix data with relative ratio values and genotypes of samples.
