

Package ‘gQTLstats’

April 14, 2017

Title gQTLstats: computationally efficient analysis for eQTL and allied studies

Version 1.6.0

Author VJ Carey <stvjc@channing.harvard.edu>

Description computationally efficient analysis of eQTL, mQTL, dsQTL, etc.

Suggests geuvPack, geuvStore2, Rsamtools, knitr, rmarkdown, ggbio, BiocStyle, Homo.sapiens, RUnit, multtest

Depends R (>= 3.1.0)

Imports methods,.snpStats, BiocGenerics, S4Vectors (>= 0.9.25), IRanges, GenomeInfoDb, GenomicFiles, GenomicRanges, SummarizedExperiment, VariantAnnotation, Biobase, BatchJobs, gQTLBase, limma, mgcv, dplyr, AnnotationDbi, GenomicFeatures, ggplot2, reshape2, doParallel, foreach, ffbase, BBmisc, beeswarm

Maintainer VJ Carey <stvjc@channing.harvard.edu>

License Artistic-2.0

LazyLoad yes

VignetteBuilder knitr

BiocViews SNP, GenomeAnnotation, Genetics

NeedsCompilation no

computationally efficient analysis of eQTL, mQTL, dsQTL, etc.

Details

The DESCRIPTION file:

Package:	gQTLstats
Title:	gQTLstats: computationally efficient analysis for eQTL and allied studies
Version:	1.6.0
Author:	VJ Carey <stvjc@channing.harvard.edu>
Description:	computationally efficient analysis of eQTL, mQTL, dsQTL, etc.
Suggests:	geuvPack, geuvStore2, Rsamtools, knitr, rmarkdown, ggbio, BiocStyle, Homo.sapiens, RUnit, multtest
Depends:	R (>= 3.1.0)
Imports:	methods,.snpStats, BiocGenerics, S4Vectors (>= 0.9.25), IRanges, GenomeInfoDb, GenomicFiles, Geno
Maintainer:	VJ Carey <stvjc@channing.harvard.edu>
License:	Artistic-2.0
LazyLoad:	yes
VignetteBuilder:	knitr
BiocViews:	SNP, GenomeAnnotation, Genetics

Index of help topics:

FDRsupp-class	Class '"FDRsupp"
TransStore	Instance constructor for managing trans gQTL results
TransStore-class	Class '"TransStore"
cisAssoc	test for variant-expression associations in cis, using VCF
clipPCs	transformations of expression data in smlSet instances
directPlot	visualize relationship between empirical and modeled FDR based on analysis of a gQTL store
enumerateByFDR	filter a ciseStore instance using an FDR

	threshold
eqBox2	visualization of expression or other assay measure against genotypes extracted from VCF
filtFDR	illustration of FDRsupp class
gQLTs	use SummarizedExperiment to manage a collection of gQTL results of interest
gQLstats-package	gQLstats: computationally efficient analysis for eQTL and allied studies
hmm878	labeled GRanges with ChromHMM chromatin states for GM12878
manhWngr	manhattan plot with named GRanges
mixedVCFtoSnpMatrix	amalgamate called genotypes and imputed allelic dosages in VCF to SnpMatrix representation
pifdr	utility for computing plug-in FDR
qqStore	create a binned QQplot for a sharded store
queryVCF	obtain SnpMatrix from VCF genotypes
senstab	create a plottable table for eQTL sensitivity analysis visualization
setFDRfunc	estimate and store function relating association scores to approximate plug-in FDR
storeToQuantiles	extract a vector from store results as ff (out of memory reference); support statistical reductions
transAssoc	compute 'trans' SNP-feature associations by wrapping AllAssoc
txsPlot	visualize transformed FDR against transformed association statistics

This package addresses the management of map-reduce like computations for cis-association tests between DNA variants and genomic features like gene expression measurements. It makes essential use of data structures defined in package gQLBase.

A number of experimental functions are present in the current version of the package: prep.cisAssocNB (assembles information to assess negative binomial regression in cis association testing), storeToMaxAssocBySNP (progress towards SNP-specific FDR), table_sensobj_thresh (reporting on sensitivity analysis).

Additional experimental functions are available to support scalable trans-gQTL testing TransChunk, filteredDFwPerm, and transTable operate on output of AllAssoc.

cisAssoc

test for variant-expression associations in cis, using VCF

Description

test for variant-expression associations in cis, using VCF and RangedSummarizedExperiment representations

Usage

```
cisAssoc(summex, vcf.tf, rhs = ~1, nperm = 3, cisradius =
      50000, genome = "hg19", assayind = 1, lbmaf = 1e-06,
      lbgtf = 1e-06, dropUnivHet = TRUE, infoFields =
      c("LDAF", "SVTYPE"), simpleSNV = TRUE)
cisEsts(summex, vcf.tf, rhs = ~1, nperm = 3, cisradius =
      50000, genome = "hg19", assayind = 1, lbmaf = 1e-06,
      lbgtf = 1e-06, dropUnivHet = TRUE, infoFields =
      c("LDAF", "SVTYPE"), simpleSNV = TRUE)
cisCount(summex, vcf.tf, rhs = ~1, cisradius =
      50000, genome = "hg19", assayind = 1, lbmaf = 1e-06,
      lbgtf = 1e-06, dropUnivHet = TRUE, infoFields =
      c("LDAF", "SVTYPE"), simpleSNV = TRUE)
AllAssoc(summex, vcf.tf, variantRange, rhs = ~1, nperm = 3,
      genome = "hg19", assayind = 1, lbmaf = 1e-06, lbgtf = 1e-06,
      dropUnivHet = TRUE, infoFields = c("LDAF", "SVTYPE"))
```

Arguments

summex	a <code>RangedSummarizedExperiment</code> object
vcf.tf	instance of <code>TabixFile</code> , referring to a tabix-indexed, bgzipped VCF file
rhs	formula ‘right hand side’ for adjustments to be made as <code>snp.rhs.tests</code> is run on each expression vector
nperm	number of permutations to be used for plug-in FDR computation
cisradius	distance in bp around each gene body to be searched for SNP association
genome	tag suitable for use in GenomeInfoDb structures
assayind	index of <code>assays(summex)</code> to use for expression data retrieval
lbmaf	lower bound on MAF of SNP to retain for analysis, computed using <code>col.summary</code>
lbgtf	lower bound on genotype frequency of SNP to retain for analysis
dropUnivHet	logical, if TRUE, will check for columns of <code>SnpMatrix</code> instance that possess no values other than "NA" and "A/B". See http://www.biostars.org/p/117155/#117270
infoFields	character – VCF fields to retain in <code>vcfInfo()</code> part of query
simpleSNV	logical – will use simple computation of <code>isSNV</code> to filter variants for analysis to SNV
variantRange	<code>GRanges</code> instance that defines the scope of the VCF to be used for testing against all features on summex

Details

`snp.rhs.tests` is the workhorse for statistical modeling. VCF content is transformed to the byte-code (which allows for uncertain imputation) and used in fast testing.

Value

`cisAssoc`: a `GRanges-class` instance with mcols including chisq, permScore...

`cisCount`: enumerate locations in VCF that would be tested

Note

seqlevelsStyle for summex and vcf.tf content must agree

Author(s)

VJ Carey <stvjd@channing.harvard.edu>

Examples

```
require(GenomeInfoDb)
require(geuvPack)
require(Rsamtools)
data(geuFPKM)
lgeu = geuFPKM[ which(seqnames(geuFPKM)=="chr20"), ]
seqlevelsStyle(lgeu) = "NCBI"
tf20 = TabixFile(system.file("vcf/c20exch.vcf.gz", package="gQTLstats"))
if (require(VariantAnnotation)) scanVcfHeader(tf20)
lgeue = clipPCs(lgeu[,which(lgeu$popcode=="CEU")], 1:2)
set.seed(1234)
litzc = cisAssoc(lgeue[c(162,201),], tf20, nperm=2, lbfmaf=.05, cisradius=50000)
set.seed(1234)
lite = cisEsts(lgeue[c(162,201),], tf20, nperm=2, lbfmaf=.05, cisradius=50000)
summary(lite$chisq)
mystr = range(litzc)
litzc$pifdr = gQTLstats:::pifdr(litzc$chisq, c(litzc$permScore_1, litzc$permScore_2))
litzc[which(litzc$pifdr < .01)]
lita = AllAssoc(geuFPKM[1:10,], tf20, mystr)
lita3 = AllAssoc(geuFPKM[11:20,], tf20, mystr)
#lita5 = AllAssoc(geuFPKM[21:30,], tf20, mystr)
n1 = gQTLstats:::collapseToBuf(lita, lita3)
#n1 = collapseToBuf(n1, lita5)
```

clipPCs

transformations of expression data in smlSet instances
Description

transformations of expression data in smlSet instances or assay data in RangedSummarizedExperiment

Usage

```
clipPCs(x, inds2drop, center = TRUE)

regressOut(x, rhs, ...)
```

Arguments

x	a RangedSummarizedExperiment object
inds2drop	Vector of PCs to be eliminated by setting the associated diagonal elements in the SVD to zero before recomposing the matrix of expression values. If the value 0 is present in inds2drop, the smlSet is returned unchanged, with a message.

center	logical, passed to prcomp
rhs	formula fragment (no dependent variable) used to form residuals in a reexpression of the expression matrix; variable bindings found in pData of an ExpressionSet or colData of a RangedSummarizedExperiment
...	arguments passed to lmFit

Details

`clipPCs` is an operation on the $n \times p$ transposed matrix X of expression data. The singular value decomposition $X = UDV^t$ is formed, the diagonal elements of D corresponding to `inds2drop` are set to zero yielding the diagonal matrix E , and then $Y = UEV^t$ is computed and transposed to replace the expression data.

`regressOut` obtains residuals after genewise regression of expression on the design matrix specified by the `rhs`; [lmFit](#) is used to compute coefficients, linear predictions and residuals.

Value

a [RangedSummarizedExperiment](#) object

Author(s)

VJ Carey <stvjc@channing.harvard.edu>

References

The use of PCA-based adjustments to remove mass extraneous effects from expression matrices has been criticized in work of Oliver Stegle and Jeffrey Leek, who offer Bayesian PEER and SVA respectively as alternative solutions.

Examples

```
if(require(geuvPack)){
  data(geuFPKM)
  cg = clipPCs(geuFPKM, 1:10)
  ro = regressOut(cg, ~popcode)
  ro
}
```

<code>directPlot</code>	<i>visualize relationship between empirical and modeled FDR based on analysis of a gQTL store</i>
-------------------------	---

Description

visualize relationship between empirical and modeled FDR based on analysis of a gQTL store

Usage

`directPlot(FDRsupp)`

Arguments

FDRsupp	instance of FDRsupp-class
---------	---

Details

This plot is used to show the degree of fit between a smooth model relating modeled FDR to empirical FDR, and the empirical FDR themselves. It should be used in conjunction with [txsPlot](#).

It is possible for an implausible squiggly model to yield perfect agreement for all empirical FDR estimates. See the example.

Examples

```
data(filtFDR)
directPlot(filtFDR)
```

enumerateByFDR	<i>filter a ciseStore instance using an FDR threshold</i>
----------------	---

Description

filter a ciseStore instance using an FDR threshold

Usage

```
enumerateByFDR(store, fdrsupp, threshold = 0.05, filter=force,
               ids=NULL, trimToUnit=TRUE)
```

Arguments

store	instance of ciseStore-class
fdrsupp	instance of FDRsupp-class
threshold	upper bound on FDR to be included
filter	The FDR can be computed for any association score. To return only records satisfying a given filter, supply the filter function here. It may be desirable to carry a filter function from the storeToFDR stage, and this may be considered in future versions.
ids	if NULL, process all results in store, otherwise limit attention to jobs with id values in ids
trimToUnit	plug-in FDR estimates can sometimes lie outside [0,1] owing to sparsity or defects of extrapolation; if this parameter is TRUE, estimated FDR values outside [0,1] are moved to the nearest boundary

Details

uses [storeApply](#), which will use BiocParallel infrastructure when available

Value

A GRanges instance with store contents to which estFDR is appended for each range. The estFDR quantity is predicted using the GAM model held in the FDRsupp instance.

Examples

```
require(geuvStore2)
require(gQTLBase)
st = makeGeuvStore2()
data(filtFDR)
filtEnum = enumerateByFDR( st, filtFDR,
  filter=function(x)x[which(x$mindist <= 500000 & x$MAF >= 0.05)] )
names(metadata(filtEnum))
filtEnum[order(filtEnum$chisq, decreasing=TRUE)[1:2]]
```

eqBox2

visualization of expression or other assay measure against genotypes extracted from VCF

Description

visualization of expression or other assay measure against genotypes extracted from VCF

Usage

```
eqBox2(gene, se, tf, snpgr, genome = "hg19", forceRs=TRUE, ...)
eqDesc2(gene, se, tf, snpgr, genome = "hg19", forceRs=TRUE)
```

Arguments

gene	an element of rownames(se) from which a vector of assay values will be created
se	a RangedSummarizedExperiment object
tf	instance of class TabixFile-class , defining paths to a tabix-indexed VCF and index file
snpgr	instance of GRanges-class identifying the SNP to be visualized
genome	tag identifying reference genome
forceRs	In the 1000 genomes VCF, there are sometimes variants identified with DELLY that are grabbed by readVcf on an SNV address. Set forceRs to TRUE to retain only variants with 'rs' in the name. Has no effect if readVcf extracts only a single variant.
...	extra arguments passed to beeswarm

Details

In 1.5.4, altered to supply beeswarm data visualization in addition to boxplot. Use additional option corral="gutter" to reduce horizontal sprawl in large samples.

Examples

```
require(Rsamtools)
require(SummarizedExperiment)
mygr = GRanges("1", IRanges(54683925, width=1))
gene = "ENSG00000231581.1"
library(geuvPack)
data(geuFPKM)
```

```
#tf = gtpath(1)
tf = TabixFile(system.file("vcf/small_1.vcf.gz", package="gQTLstats"))
eqBox2(gene, se=geuFPKM, tf, mygr )
eqDesc2(gene, se=geuFPKM, tf, mygr )
```

FDRsupp-class

Class "FDRsupp"

Description

Support for FDR computations with ciseStore instances

Objects from the Class

Objects can be created by calls of the form `new("FDRsupp", ...)`.

Slots

tab: Object of class "data.frame" a table with association scores and plug-in FDR estimates evaluated on selected score values

FDRfunc: Object of class "function" a function of one argument with input association score and output the corresponding FDR estimate

FDRmodel: Object of class "gam" that was fit to elements of `tab`

filterUsed: Object of class "function" a copy of the function used for filtering the store to create the `FDRfunc` element.

sessinfo: `sessionInfo()` value at time of construction

theCall: instance of class "call" showing call leading to construction

Methods

getFDRfunc `signature(x = "FDRsupp")`: extract the FDR approximating function, a function of one (vector) argument assumed to represent association scores, evaluating to the plug-in FDR estimates corresponding to these scores

getTab `signature(x = "FDRsupp")`: extract the table of association scores and empirical FDR estimates

Note

Typically the `FDRfunc` function is constructed using a smooth model relating the estimated FDR to association scores.

Examples

```
showClass("FDRsupp")
```

filtFDR*illustration of FDRsupp class***Description**

illustration of FDRsupp class

Usage

```
data("filtFDR")
```

Format

A FDRsupp object.

Details

`filtFDR` was constructed on `geuvStore` contents, filtering to MAF at least five percent and radius at most 500kbp. `rawFDR` uses the entire `geuvStore` contents, with 1Mbp radius and 1 percent MAF lower bound

Examples

```
data(filtFDR)
filtFDR
```

gQTLs*use SummarizedExperiment to manage a collection of gQTL results of interest***Description**

use `SummarizedExperiment` to manage a collection of gQTL results of interest

Usage

```
gQTLs(filtgr, se, tf, genome = "hg19", forceRs = TRUE, chunksize = 50)
gQTLswarm(se, ind, covar = NULL, inpch = 19, xlab, ylab, featTag="probeid", ...)
```

Arguments

<code>filtgr</code>	a GRanges instance typically obtained by filtering a ciseStore instance
<code>se</code>	SummarizedExperiment with individual level expression and sample-level data from which <code>filtgr</code> statistics were derived; for <code>gQTLswarm</code> , output of <code>gQTLs</code>
<code>tf</code>	TabixFile for VCF on which <code>filtgr</code> statistics are based
<code>genome</code>	tag for <code>readVcf</code>
<code>forceRs</code>	if TRUE insist that snp ids include 'rs'
<code>chunksize</code>	VCF processing proceeds via foreach in chunks of size <code>chunksize</code>

ind	index into rows of se to be used for visualization, must be length 1
covar	a character string indicating a variable in colData(se) to be used to color the points
inpch	pch setting for dots in swarm
xlab	xlabel for beeswarm plot, defaults to snp id as recovered from rowRanges(se)\$snp
ylab	ylabel for beeswarm plot, defaults to probe id as recovered from rowRanges(se)\$probeid
featTag	element of mcols(rowRanges(se)) used to find ylab text, defaults to 'probeid', 'symbol' is often preferred
...	passed to beeswarm

Value

a SummarizedExperiment instance with two assays, the first is genotype the second is expression

Note

very preliminary

Examples

```
require(Rsamtools)
tf = TabixFile(system.file("vcf/litv.vcf.gz", package="gQTLstats"))
data(sigInlit) # 33 loci with significant cis eQTL on a specific filtering
library(geuvPack)
data(geuFPKM)
require(doParallel)
registerDoSEQ()
gdem = gQTLs(sigInlit, geuFPKM, tf, genome = "hg19")
gQTLswarm(gdem, 1, "popcode")
```

hmm878

labeled GRanges with ChromHMM chromatin states for GM12878
Description

labeled GRanges with ChromHMM chromatin states for GM12878

Usage

```
data(hmm878)
```

Format

The format is:

```

Examples

```
data(hmm878)
table(hmm878$name)
```

`manhWngr`

manhattan plot with named GRanges

Description

manhattan plot with named GRanges

Usage

```
manhWngr(store, probeid = "ENSG00000183814.10", sym = "LIN9", fdrSupp, namedGR, slstyle = "NCBI", ...)
```

Arguments

<code>store</code>	instance of ciseStore-class
<code>probeid</code>	name of feature identifier to use for cis association
<code>sym</code>	symbol for feature identifier
<code>fdrSupp</code>	instance of FDRsupp-class
<code>namedGR</code>	GRanges instance with 'name' in mcols element
<code>slstyle</code>	seqlevelsStyle
<code>xlab.in</code>	x axis label
<code>ylab.in</code>	y axis label
<code>applyFDRfilter</code>	if TRUE, use the filter defined in the filterUsed element of the object supplied as <code>fdrSupp</code> on the output
<code>...</code>	additional arguments for plotting

Examples

```
require(geuvStore2)
require(gQTLBase)
store = makeGeuvStore2()
data(hmm878)
data(filtFDR)
manhWngr(store, fdrSupp=filtFDR, namedGR=hmm878)
```

`mixedVCFtoSnpMatrix` *amalgamate called genotypes and imputed allelic dosages in VCF to SnpMatrix representation*

Description

amalgamate called genotypes and imputed allelic dosages in VCF to SnpMatrix representation

Usage

```
mixedVCFtoSnpMatrix(vcf, preferGT = TRUE)
```

Arguments

<code>vcf</code>	object inheriting from CollapsedVCF-class
<code>preferGT</code>	logical. VCF allows loci for samples to be reported in various formats, and a given locus can have a call tagged GT and a genotype probability or likelihood representation tagged GP or GL. genotypeToSnpMatrix has an uncertain parameter that, if TRUE, will transform GP or GL content to allelic dose. Note that only the "first" dosage type appearing in the header will be transformed. Thus if GP is first in the header but a given locus is tagged only with GL, the genotype for thus locus will be recorded as NA.

Details

emulates output from [genotypeToSnpMatrix](#)

Value

list with elements `genotypes` and `map`

Author(s)

VJ Carey

See Also

[genotypeToSnpMatrix](#)

Examples

```
fn = system.file("vcf/polytypeSNV.vcf", package="gQTLstats")
require("VariantAnnotation")
require("snpStats")
vv = readVcf(fn, genome="hg19") # only 4th SNP will have dosage coding
mixedVCFtoSnpMatrix(vv)$genotypes@.Data
```

pifdr*utility for computing plug-in FDR*

Description

utility for computing plug-in FDR

Usage

```
pifdr( obs, perms, trimToUnit = TRUE, ... )
```

Arguments

obs	observed association scores
perms	vector of association scores under permutation; length should be integer multiple of <code>length(obs)</code>
trimToUnit	logical, if TRUE, values greater than 1 are replaced by 1. Such values can occur, for example, with relatively small sample sizes.
...	extra arguments ignored

Details

Revised 12/30/13 to employ `hist()` to rapidly bin the permuted values.

Value

vector of plug-in FDR estimates congruent to `obs`

References

Hastie Tibshirani and Friedman Elements of Statistical Learning ch 18.7

Examples

```
set.seed(1234)
op = par(no.readonly=TRUE)
par(mfrow=c(2,2))
X = c(rchisq(30000,1),rchisq(300,10))
Y = rchisq(30300*3,1)
qqplot(Y, X, xlab="null", ylab="observed")
hist(pp <- pifdr(X,Y), xlab="plug-in FDR", main=" ")
library(multtest)
rawp = 1-pchisq(X, 1)
MT <- mt.rawp2adjp(rawp)
MT2 = MT[[1]][order(MT[[2]]),]
plot(MT2[, "BH"], pp, xlab="BH FDR", ylab="plug-in FDR")
par(op)
```

`qqStore`*create a binned QQplot for a sharded store*

Description

create a binned QQplot for a sharded store with association and permutation statistics

Usage

```
qqStore(st, ids = NULL,
        .probs = c(0, seq(0.6, 0.8, 0.2), 0.9, 0.95, 0.99, 0.999, 0.9999, 1),
        xlim.in = c(0.2, 75), lowfac = 0.5, xlab = "Permutation distribution",
        ylab = "Distribution of score statistic", countpos = 50,
        plot.it = TRUE, doab = TRUE, scoreField = "chisq",
        permField = "permScore_1", ...)
```

Arguments

<code>st</code>	instance of <code>ciseStore-class</code>
<code>ids</code>	optional job id vector; if <code>NULL</code> , all jobs used
<code>.probs</code>	vector of probabilities for use with quantile evaluation, as provided in <code>ffbase</code> , using <code>storeToQuantiles</code>
<code>xlim.in</code>	xlim setting for QQplot
<code>lowfac</code>	we use a log-log plot, and the first quantile (as prescribed in <code>.probs</code>) is often close to zero; we reassign it to <code>lowfac*(second quantile)</code>
<code>xlab</code>	label
<code>ylab</code>	label
<code>countpos</code>	where on the x axis will we stack the information on bin counts
<code>plot.it</code>	logical, if <code>FALSE</code> , a list is returned with elements on quantile values and bin counts
<code>doab</code>	logical prescribing drawing of line of identity
<code>scoreField</code>	tag in store naming the statistic, typically ' <code>chisq</code> ', can also be ' <code>tstat</code> ' for GTEX
<code>permField</code>	tag in store naming the field holding statistics on realizations from permutation distribution
<code>...</code>	passed to <code>storeToQuantiles</code>

Value

invisibly returns list with elements `qx`, `qy`, `counts`, `fracs`

Examples

```
## Not run:
library(geuvStore2)
library(gQTLBase)
gs = makeGeuvStore2()
qqStore(gs, #, ids=partialIds()[1:20])

## End(Not run)
```

queryVCF	<i>obtain SnpMatrix from VCF genotypes</i>
----------	--

Description

obtain SnpMatrix from VCF genotypes

Usage

```
queryVCF(gr, vcf.tf, samps, genome = "hg19", getSM = TRUE,
        snvOnly=TRUE)
```

Arguments

gr	GRanges instance; SNPs lying within will be processed
vcf.tf	TabixFile instance pointing to VCF
samps	samples to be retained
genome	tag identifying build
getSM	logical; if FALSE, <code>genotypeToSnpMatrix</code> will not be run and only the output of <code>readVcf</code> is returned.
snvOnly	logical, if TRUE, will confine results to SNV

Value

a list of length two

readout	output of <code>readVcf</code>
sm	output of <code>genotypeToSnpMatrix</code> run on the read result

Examples

```
require(Rsamtools)
tf20 = TabixFile(system.file("vcf/c20exch.vcf.gz", package="gQTLstats"))
require(geuvPack)
data(geuFPKM)
lgeu = geuFPKM[ which(seqnames(geuFPKM)=="chr20"),
               which(geuFPKM$popcode=="CEU") ]
seqlevelsStyle(lgeu) = "NCBI"
rng = rowRanges(lgeu)[232] # CPNE1
myq = queryVCF( rng, tf20, samps=colnames(lgeu), genome="hg19" )
myq
```

senstab *create a plottable table for eQTL sensitivity analysis visualization*

Description

create a plottable table for eQTL sensitivity analysis visualization

Usage

```
senstab(x, filt = force)
## S3 method for class 'senstab'
plot(x, ...)
```

Arguments

- | | |
|------|---|
| x | a list generated by a process analogous to the sensitivity survey exhibited in the example below |
| filt | a function that operates on and returns a data.frame; typically will select rows based on values of fields 'MAF' and 'radius' |
| ... | extra arguments passed to plot |

Details

`sensByProbe` is a list structure; for information on this and other elements of sensitivity analysis workflow, see extensive non-executed code in example below

Value

an instance of the S3 class 'senstab', 'data.frame'

Examples

```

sens40ne = function(z) {
  load("../bigStore.rda") # get a ciseStore instance
  ans = storeToFDRByProbe(bigStore, xprobs=seq(.01,.99,.01), # xprobs
                         # needs to be chosen with care
  filter=function(x) x[which(x$MAF >= parms[z,1] &
    x$mindist <= parms[z,2])])
  ans = setFDRfunc(ans, span=.35) # span can be important
  list(fdrsupp=ans, parms=parms[z,])
}

batchMap(sens1, sens40ne, 1:nrow(parms))
submitJobs(sens1)

# now loadResult(sens1) or the equivalent can be the input to senstab()
# as in the example to continue here:

## End(Not run)
library(gQTLstats)
data(sensByProbe)
ptab = t(sapply(sensByProbe, function(x)as.numeric(x[[2]])))
unique(ptab[,1]) # MAFs used
unique(ptab[,2]) # radii used
# here we filter away some extreme values of the design space
tab = senstab(sensByProbe, filt=function(x) {
  x[ x$radius > 10000 & x$ radius < 500000 & x$MAF > .03, ]
})
plot(tab)

```

setFDRfunc

estimate and store function relating association scores to approximate plug-in FDR

Description

estimate and store function relating association scores to approximate plug-in FDR

Usage

```
setFDRfunc(FDRsupp, fudge = 1e-06, zthresh = 30, maxch = 30, ...)
```

Arguments

FDRsupp	instance of FDRsupp-class
fudge	if FDR is zero, a log or logistic transform will fail; we add the small positive number fudge to avoid this
zthresh	for association scores greater than this value, a hard value of FDR 0 is assigned
maxch	the model for the functional relationship between association and FDR is subset to observations for which association chisq score is no greater than 1.1*maxch
...	arguments passed to s for the smooth model relating association score to FDR at selected quantiles of the association score distribution

Value

returns an updated [FDRsupp-class](#) instance

Examples

```
data(filtFDR)
filtFDR2 = setFDRfunc(filtFDR)
```

storeToStats

extract a vector from store results as ff (out of memory reference); support statistical reductions

Description

extract a vector from store results as ff (out of memory reference); support statistical reductions

Usage

```
storeToQuantiles(store, field,
                 probs=c(seq(0,.999,.001), 1-(c(1e-4,1e-5,1e-6,1e-7))),
                 ids = NULL, ..., checkField = FALSE, filter=force)
storeToHist(store, getter = function(x)
             as.numeric(S4Vectors::as.matrix(mcols(x)[,
               grep("permScore", names(mcols(x)))])), breaks, ids =
               NULL, filter = force)
storeToFDR(store, xprobs = c(seq(0, 0.999, 0.001), 1 - (c(1e-04,
               1e-05, 1e-06, 1e-07))), xfield = "chisq", getter =
               function(x) as.numeric(S4Vectors::as.matrix(mcols(x)[,
                 grep("permScore", names(mcols(x)))])), filter = force,
               .id4coln=1, ids=NULL)
```

Arguments

store	instance of ciseStore-class
field	character tag, length one, must be name of a numeric field in the result set (typically something like 'chisq' in the GRanges generated by cisAssoc)
xfield	as field , for FDR computation, see Details.
ids	job ids to be used; if NULL, process all jobs
breaks	boundaries of histogram bins
...	supplied to makeRegistry for a temporary registry: typically will be a vector of package names if additional packages are needed to process results
checkField	if TRUE steps will be taken to verify that the tag to which 'field' evaluates is present in result in the first job
probs	numeric vector of probabilities with values in [0,1]. See quantile.ff .
xprobs	percentiles of the empirical distribution of the association statistic at which FDR estimates are recorded.
getter	function of a single argument that extracts a numeric vector of association scores obtained under permutation

x	instance of FDRsupp
filter	function accepting and returning GRanges instance, executed when cisAssoc result is loaded to modify that result, defaults to no-op
.id4coln	job id to be used for initial probe to determine names of fields in mcols of all jobs

Details

uses current BatchJobs configuration to parallelize extraction; reduceResults could be used for a sequential solution

Value

storeToQuantiles and storeToHist return objects analogous to those returned by stats::quantile and graphics::hist.

However, it should be noted that storeToQuantiles will use the [quantile.ff](#) of ffbase. For vectors of modest length, this can disagree with results of base::quantile by a few percent.

storeToFDR and storeToFDRByProbe return an instance of FDRsupp class

Note

uses ffbase:::c.ff explicitly to concatenate outputs; there is no guarantee of order among elements

Examples

```
stopifnot(require(geuvStore2))
require(BatchJobs)
require(gQTLBase)
store = makeGeuvStore2()
library(doParallel)
if (.Platform$OS.type == "windows") {
  registerDoSEQ()
} else registerDoParallel(cores=max(c(detectCores()-1,1)))
smchisq = storeToFF( store, "chisq", ids=store@validJobs[1:3])
smchisq
if (.Platform$OS.type != "windows") { # avoid timeout
  qs = storeToQuantiles( store, "chisq", ids = store@validJobs[1:5],
    probs=seq(.1,.9,.1) )
  qs
  hh = storeToHist( store, ids = store@validJobs[1:5], breaks=
    c(0,qs,1e9) )
  hh$counts
  fd = storeToFDR( store, xprobs=c(seq(.05,.95,.05),.99,.999) )
  tail(getTab(fd),4)
  sss = storeToFDRByProbe( store , xprobs=c(seq(.05,.95,.05),.99) )
  tail(getTab(sss),4)
}
```

<code>transAssoc</code>	<i>compute 'trans' SNP-feature associations by wrapping AllAssoc</i>
-------------------------	--

Description

compute 'trans' SNP-feature associations by wrapping AllAssoc, retaining only the strongest associations (and similarly filtered association scores computed under permutation)

Usage

```
transAssoc(variantGR, exSE, vcfgen, bufsize = 10, nperm = 3, exChLen = 2 * bufsize, ...)
```

Arguments

variantGR	GRanges instance establishing scope of variants to test
exSE	SummarizedExperiment instance, all of whose features will be tested for association with all SNP
vcfgen	a function returning a path to a tabix-indexed VCF file from which SNP genotypes will be extracted
bufsize	Size of 'buffer' used to retain largest feature association scores encountered during the search. The scores and the names of associated genes are retained in 'scorebuf' and 'elnames' components of output GRanges
nperm	number of permutations of features against genotypes to be performed for realizing null distribution of association scores
exChLen	size of chunks of exSE to be tested through calls to AllAssoc; this is intended to allow control of RAM usage
...	arguments passed to AllAssoc

Value

a GRanges with mcols including

Examples

```
## Not run: # requires access to 1KG S3
library(geuvPack)
data(geuFPKM)
seqlevelsStyle(geuFPKM) = "NCBI"
mysr = GRanges("20", IRanges(33000055, 33020055))
genome(mysr) = "hg19"
tt = transAssoc(mysr, geuFPKM[1:16,],
  bufsize=3, exChLen=4, vcfgen=function(x)gtpath(paste0("chr", x)) )
colnames(mcols(tt))
table(as.character(mcols(tt)$elnames))

## End(Not run)
```

TransStore*Instance constructor for managing trans gQTL results*

Description

Instance constructor for managing trans gQTL results

Usage

```
TransStore(regs, paths = NULL)
```

Arguments

- | | |
|-------|--|
| regs | a list of Registry instances, typically one per (variant-oriented) chromosome |
| paths | if desired, paths to folders for which loadRegistry succeeds, used instead of regs |

Value

instance of [TransStore-class](#)

Examples

```
## Not run: # requires devel experimental as of april 15 2016
if (require(geuvStore2) && require(doParallel)) {
  registerDoSEQ()
  r17 = g17transRegistry()
  r18 = g18transRegistry()
  g1718 = TransStore(list(r17, r18))
  g1718
}

## End(Not run)
```

TransStore-class

Class "TransStore"

Description

Manage collection of related trans-gQTL results in BatchJobs registries, typically one per chromosome

Objects from the Class

Objects can be created by calls of the form `new("TransStore", ...)`.

Slots

allRegistries: Object of class "list" containing [Registry](#) instances
numSubmitted: Object of class "numeric" records number of jobs submitted for each registry
numDone: Object of class "numeric" records number of jobs completed for each registry
nloci: Object of class "numeric" records number of loci with test results for each registry
jobinfos: Object of class "list" records results of [getJobInfo](#) for each registry

Methods

describe signature(object = "TransStore"): summarize information about a store

Examples

```
showClass("TransStore")
```

txsPlot

visualize transformed FDR against transformed association statistics

Description

visualize transformed FDR against transformed association statistics

Usage

```
txsPlot(FDRsupp, xmax=50)
```

Arguments

FDRsupp	an instance of FDRsupp-class
xmax	upper bound on xlim for display

Examples

```
data(filtFDR)
txsPlot(filtFDR)
```
