Title Analysis Of Differential Abundance Taking Sample Variation Into Account

Version 1.16.0 **Date** 2019-2-28

Author Greg Gloor, Andrew Fernandes, Jean Macklaim, Arianne Albert, Matt Links, Thomas Quinn, Jia Rong Wu, Ruth Grace Wong,

Maintainer Greg Gloor <ggloor@uwo.ca>

biocViews DifferentialExpression, RNASeq, Transcriptomics, GeneExpression, DNASeq, ChIPSeq, Bayesian, Sequencing, Software, Microbiome, Metagenomics, ImmunoOncology

Description A differential abundance analysis for the comparison of two or more conditions. Useful for analyzing data from standard RNA-seq or meta-RNA-seq assays as well as selected and unselected values from in-vitro sequence selections. Uses a Dirichlet-multinomial model to infer abundance from counts, optimized for three or more experimental replicates. The method infers biological and sampling variation to calculate the expected false discovery rate, given the variation, based on a Wilcoxon Rank Sum test and Welch's t-test (via aldex.ttest), a Kruskal-Wallis test (via aldex.kw), a generalized linear model (via aldex.glm), or a correlation test (via aldex.corr). All tests report p-values and Benjamini-Hochberg corrected p-values.

Description

A differential abundance analysis for the comparison of two or more conditions. For example, single-organism and meta-RNA-seq high-throughput sequencing assays, or of selected and unselected values from in-vitro sequence selections. Uses a Dirichlet-multinomial model to infer abundance from counts, that has been optimized for three or more experimental replicates. Infers sampling variation and calculates the expected false discovery rate given the biological and sampling variation using the Wilcox rank test or Welches t-test (aldex.ttest) or the glm and Kruskal Wallis tests (aldex.glm). Reports both P and fdr values calculated by the Benjamini Hochberg correction.

Examples

see examples for the aldex.clr, aldex.ttest, aldex.effect, aldex.glm functions

aldex 3

aldex Compute an aldex Object

Description

Welcome to the ALDEx2 package!

The aldex function is a wrapper that performs log-ratio transformation and statistical testing in a single line of code. Specifically, this function: (a) generates Monte Carlo samples of the Dirichlet distribution for each sample, (b) converts each instance using a log-ratio transform, then (c) returns test results for two sample (Welch's t, Wilcoxon) or multi-sample (glm, Kruskal-Wallace) tests. This function also estimates effect size for two sample analyses.

Usage

```
aldex(reads, conditions, mc.samples = 128, test = "t", effect = TRUE,
  include.sample.summary = FALSE, verbose = FALSE, denom = "all",
  iterate = FALSE, ...)
```

Arguments

reads A non-negative, integer-only data. frame or matrix with unique names for all

rows and columns. Rows should contain genes and columns should contain sequencing read counts (i.e., sample vectors). Rows with 0 reads in each sample

are deleted prior to analysis.

conditions A character vector. A description of the data structure used for testing. Typically,

a vector of group labels. For aldex.glm, use a model.matrix.

mc.samples An integer. The number of Monte Carlo samples to use when estimating the un-

derlying distributions. Since we are estimating central tendencies, 128 is usually

sufficient.

test A character string. Indicates which tests to perform. "t" runs Welch's t and

Wilcoxon tests. "kw" runs Kruskal-Wallace and glm tests. "glm" runs a generalized linear model using a model.matrix. "corr" runs a correlation test using

cor.test.

effect A boolean. Toggles whether to calculate abundances and effect sizes. Applies

to test = "t" and test = "iterative".

include.sample.summary

A boolean. Toggles whether to include median clr values for each sample. Ap-

plies to effect = TRUE.

verbose A boolean. Toggles whether to print diagnostic information while running. Use-

ful for debugging errors on large datasets. Applies to effect = TRUE.

denom A character string. Indicates which features to retain as the denominator for

the Geometric Mean calculation. Using "iqlr" accounts for data with systematic variation and centers the features on the set features that have variance that is between the lower and upper quartile of variance. Using "zero" is a more extreme case where there are many non-zero features in one condition but many zeros in another. In this case the geometric mean of each group is calculated using the

set of per-group non-zero features.

4 aldex

A boolean. Toggles whether to iteratively perform a test. For example, this will use the results from an initial "t" routine to seed the reference (i.e., denominator of Geometric Mean calculation) for a second "t" routine.

... Arguments to embedded method (e.g., glm or cor.test).

Details

See "Examples" below for a description of the sample input.

Value

Returns a number of values that depends on the set of options. See the return values of aldex.ttest, aldex.kw, aldex.glm, and aldex.effect for explanations and examples.

Author(s)

Greg Gloor, Andrew Fernandes, and Matt Links contributed to the original package. Thom Quinn added the "glm" test method, the "corr" test method, and the "iterate" procedure.

```

aldex.clr 5

aldex.clr	Compute an aldex.clr Object	

Description

Generate Monte Carlo samples of the Dirichlet distribution for each sample. Convert each instance using the centred log-ratio transform This is the input for all further analyses.

Usage

aldex.clr(reads, conds, mc.samples = 128, denom="all", verbose=FALSE, useMC=FALSE)

Arguments

denom

reads	A data.frame or RangedSummarizedExperiment object containing non-negative integers only and with unique names for all rows and columns, where each row is a different gene and each column represents a sequencing read-count. Rows with 0 reads in each sample are deleted prior to analysis.
conds	A vector containing a descriptor for the samples, allowing them to be grouped and compared.
mc.samples	The number of Monte Carlo samples to use to estimate the underlying distributions; since we are estimating central tendencies, 128 is usually sufficient.

A character variable (all, iqlr, zero, lvha) indicating which features to use as the denominator for the Geometric Mean calculation The default "all" uses the geometric mean abundance of all features. Using "iqlr" uses the features that are between the first and third quartile of the variance of the clr values across all samples. Using "zero" uses the non-zero features in each grop as the denominator. This approach is an extreme case where there are many nonzero features in one condition but many zeros in another. Using "lvha" uses features that have low variance (bottom quartile) and high relative abundance (top quartile in every sample). It is also possible to supply a vector of row indices to use as the denominator. Here, the experimentalist is determining a-priori which rows are thought to be invariant. In the case of RNA-seq, this could include ribosomal

protein genes and and other house-keeping genes.

verbose Print diagnostic information while running. Useful only for debugging if fails

on large datasets.

useMC Use multicore by default (FALSE). Multi core processing will be attempted with

the BiocParallel package. Serial processing will be used if this is not possible.

Details

An explicit description of the input format for the reads object is shown under 'Examples', below.

Value

The object produced by the clr function contains the clr transformed values for each Monte-Carlo Dirichlet instance, which can be accessed through getMonteCarloInstances(x), where x is the clr function output. Each list element is named by the sample ID. getFeatures(x) returns the features, getSampleIDs(x) returns sample IDs, and getFeatureNames(x) returns the feature names.

aldex.clr-class

The aldex.clr class

Description

The aldex.clr S4 class is a class which stores the data generated by the aldex.clr method.

Details

An aldex.clr object contains the Monte Carlo Dirochlet instances derived from estimating the technical variance of the raw read count data. It is created by the aldex.clr.function, which is invoked by the aldex.clr method. It consists of four attributes: the sample names, the feature names, the conditions vector (assigns each sample to a condition), and the Monte Carlo Dirochlet instances themselves. These can be accessed, along with information about the length of some attributes. A single Monte Carlo instance can also be retrieved.

aldex.clr-class 7

Value

The aldex.clr object contains the clr transformed values for each Monte-Carlo Dirichlet instance, which can be accessed through getMonteCarloInstances(x), where x is the clr function output. Each list element is named by the sample ID. getFeatures(x) returns the features, getSampleIDs(x) returns sample IDs, and getFeatureNames(x) returns the feature names.

Methods

In the code below, x is an aldex.clr object, and i is a numeric whole number.

getMonteCarloInstances(x): Returns x's Monte Carlo Dirichlet instances.

getSampleIDs(x): Returns the names of the samples. These can be used to access the original reads, as in reads\$sampleID (if the reads are a data frame).

getFeatures(x): Returns the names of the features as a vector.

numFeatures(x): Returns the number of features associated with the data.

numMCInstances(x): Returns the names of the keys that can be used to subset the data rows. The keys values are the rsid's.

getFeatureNames(x): Returns the names of the keys that can be used to subset the data rows. The keys values are the rsid's.

getReads(x): Returns the names of the keys that can be used to subset the data rows. The keys values are the rsid's.

numConditions(x): Returns the names of the keys that can be used to subset the data rows. The keys values are the rsid's.

getMonteCarloReplicate(x,i): Returns the names of the keys that can be used to subset the data rows. The keys values are the rsid's.

aldex.corr

Calculate correlation with a continuous variable

Description

aldex.corr calculates the expected values for the correlation between each feature and a continuous variable, using data returned returned by aldex.clr and a vector of the continuous variable. By default uses pearson but method="kendall" or "spearman" can be passed to the cor.test function.

Usage

```
aldex.corr(clr, cont.var, verbose = FALSE, ...)
```

aldex.effect 9

Arguments

clr An ALDEx2 object. The output of aldex.clr.

cont.var A continuous numeric vector

verbose A boolean. Toggles whether to print diagnostic information while running. Useful for debugging errors on large datasets. Applies to effect = TRUE.

... Arguments passed to cor.test.

Value

Returns a data.frame of the average coefficients and their p-values for each feature, with FDR appended as a BH column.

Author(s)

Thom Quinn, Greg Gloor

conds <- c(rep("N", 7), rep("S",7))
cont.var <- 1:14
x <- aldex.clr(selex, conds)
corr.test <- aldex.corr(x, cont.var)</pre>
```

aldex.effect

calculate effect sizes and differences between conditions

Description

determines the median clr abundance of the feature in all samples and in groups determines the median difference between the two groups determines the median variation within each two group determines the effect size, which is the median of the ratio of the between group difference and the larger of the variance within groups

Usage

```
aldex.effect(clr, verbose = TRUE, include.sample.summary = FALSE, useMC=FALSE, CI=FALSE)
```

10 aldex.effect

Arguments

clr clr is the data output of aldex.clr

verbose Print diagnostic information while running. Useful only for debugging if fails

on large datasets

include.sample.summary

include median clr values for each sample, defaults to FALSE

use multicore by default (FALSE)

CI give effect 95

Details

An explicit example for two conditions is shown in the 'Examples' below.

Value

returns a dataframe with the following information:

rab.all a vector containing the median clr value for each feature

rab.win.conditionA

a vector containing the median clr value for each feature in condition A

rab.win.conditionB

a vector containing the median clr value for each feature in condition B

diff.btw a vector containing the per-feature median difference between condition A and

В

diff.win a vector containing the per-feature maximum median difference between Dirich-

let instances within conditions

effect a vector containing the per-feature effect size

overlap a vector containing the per-feature proportion of effect size that is 0 or less

aldex.glm 11

aldex.glm	Calculate glm test statistics using a model.matrix

Description

aldex.glm calculates the expected values for each coefficient of a glm model on the data returned by aldex.clr. This function requires the user to define a model with model.matrix.

Usage

```
aldex.glm(clr, verbose = FALSE, ...)
```

Arguments

clr	An ALDEx2 object. The output of aldex.clr.
verbose	A boolean. Toggles whether to print diagnostic information while running. Useful for debugging errors on large datasets. Applies to effect = TRUE.
	Arguments passed to glm.

Value

Returns a data.frame of the average coefficients and their p-values for each feature, with FDR appended as a BH column.

ати	-	•	™

Calculate the Kruskal-Wallis test and glm ANOVA statistics

Description

aldex.kw calculates the expected values of the Kruskal-Wallis test and a glm ANOVA on the data returned by aldex.clr.

Usage

```
aldex.kw(clr, useMC = FALSE, verbose = FALSE)
```

Arguments

clr An ALDEx2 object. The output of aldex.clr.

useMC Toggles whether to use multi-core.

verbose A boolean. Toggles whether to print diagnostic information while running. Use-

ful for debugging errors on large datasets. Applies to effect = TRUE.

Value

Returns a data. frame with the following information:

a vector containing the expected p-value of the Kruskal-Wallis test for each feakw.ep

ture

kw.eBH a vector containing the corresponding expected value of the Benjamini-Hochberg

corrected p-value for each feature

a vector containing the expected p-value of the glm ANOVA for each feature glm.ep glm.eBH

a vector containing the corresponding expected value of the Benjamini-Hochberg

corrected p-value for each feature

aldex.plot 13

aldex.plot	Plot an aldex Object

Description

Create 'MW'- or 'MA'-type plots from the given aldex object.

Usage

```
## S3 method for class 'plot'
aldex( x, ..., type=c("MW","MA"),
    xlab=NULL, ylab=NULL, xlim=NULL, ylim=NULL,
    all.col=rgb(0,0,0,0.2), all.pch=19, all.cex=0.4,
    called.col=red, called.pch=20, called.cex=0.6,
    thres.line.col=darkgrey, thres.lwd=1.5,
    test=welch, cutoff=0.1, rare.col=black, rare=0,
    rare.pch=20, rare.cex=0.2 )
```

Arguments

X	an object of class aldex produced by the aldex function
	optional, unused arguments included for compatibility with the S3 method signature
type	which type of plot is to be produced. MA is a Bland-Altman style plot; MW is a difference between to a variance within plot as described in the paper
test	the method of calculating significance, one of: welch = welch's t test; wilcox = wilcox rank test; glm = glm; kruskal = Kruskal-Wallace test
cutoff	the Benjamini-Hochberg fdr cutoff, default 0.1
xlab	the x-label for the plot, as per the parent plot function
ylab	the y-label for the plot, as per the parent plot function
xlim	the x-limits for the plot, as per the parent plot function
ylim	the y-limits for the plot, as per the parent plot function
all.col	the default colour of the plotted points
all.pch	the default plotting symbol
all.cex	the default symbol size
called.col	the colour of points with false discovery rate, $q \le 0.1$
called.pch	the symbol of points with false discovery rate, $q \le 0.1$
called.cex	the character expansion of points with false discovery rate, $q \le 0.1$
thres.line.col	the colour of the threshold line where within and between group variation is equivalent
thres.lwd	the width of the threshold line where within and between group variation is equivalent
rare	relative abundance cutoff for rare features, default 0 or the mean abundance
rare.col	color for rare features, default black
rare.pch	the default symbol of rare features
rare.cex	the default symbol size of rare points

14 aldex.set.mode

Details

This particular specialization of the plot function is relatively simple and provided for convenience. For more advanced control of the plot is is best to use the values returned by summary(x).

Value

None.

aldex.set.mode

identify set of denominator features for log-ratio calculation

Description

calculate the features that are to be used as the denominator for the Geometric Mean calculation in clr_function.R

Usage

```
aldex.set.mode(reads, conds, denom="all")
```

Arguments

reads A data frame containing the samples and features per sample. conds A vector describing which samples belong to what condition.

denom Character argument specifying which indicies to return. 'all' returns all features

in both conditons. 'zero' returns the nonzero count features per condition. 'iqlr' returns the features whose variance falls within the inter-quantile range of the CLR-transformed data. In cases of malformed or null queries, input defaults to 'all'. Additionally, the input can be a numeric vector, which contains a set of row indicies to center the data against. Only for advanced users who can

pre-determine the invariant set of features within their data.

Details

An explicit example for two conditions is shown in the 'Examples' below.

Value

Outputs a vector containing indicies per condition.

aldex.ttest 15

Examples

```
# x is the output of the \c clr(data, mc.samples)} function # conditions is a description of the data # for the selex dataset, conditions <- c(rep("N", 7), rep("S", 7)) # input can be "all", "iqlr", "zero" or numeric for advanced users data(selex) #subset for efficiency selex <- selex[1201:1600,] conds <- c(rep("NS", 7), rep("S", 7)) x <- aldex.clr(selex, conds, mc.samples=2, denom="all")
```

aldex.ttest

Calculate Wilcoxon Rank Sum test and Welch's t-test statistics

Description

aldex.ttest calculates the expected values of the Wilcoxon Rank Sum test and Welch's t-test on the data returned by aldex.clr.

Usage

```
aldex.ttest(clr, paired.test = FALSE, hist.plot = FALSE,
    verbose = FALSE)
```

Arguments

clr An ALDEx2 object. The output of aldex.clr.

paired.test Toggles whether to calculate paired tests.

hist.plot Toggles whether to plot a histogram of p-values for the first Dirichlet Monte Carlo instance.

verbose A boolean. Toggles whether to print diagnostic information while running. Useful for debugging errors on large datasets. Applies to effect = TRUE.

16 getDenom

Value

Returns a data. frame with the following information:

we.ep	a vector containing the expected p-value of Welch's t-test for each feature
we.eBH	a vector containing the corresponding expected value of the Benjamini-Hochberg corrected p-value for each feature
wi.ep	a vector containing the expected p-value of the Wilcoxon Rank Sum test for each feature
wi.eBH	a vector containing the corresponding expected value of the Benjamini-Hochberg corrected p-value for each feature

```
data(selex)
#subset for efficiency
selex <- selex[1201:1600,]
conds <- c(rep("NS", 7), rep("S", 7))
x <- aldex.clr(selex, conds, mc.samples=2, denom="all")
ttest.test <- aldex.ttest(x)</pre>
```

getDenom

getDenom

Description

Returns the denominator used as the basis for the log-ratio, for an aldex.clr object.

Usage

```
getDenom(.object)
```

Arguments

.object

A aldex.clr object containing the Monte Carlo Dirochlet instances derived from estimating the technical variance of the raw read count data, along with sample and feature information.

Details

Returns the denominator used to calculate the log-ratios. "all" is the centred log-ratio. "iqlr" is the interquartile log-ratio. A vector of numbers is the offset of the variables used in the denominator

getFeatureNames 17

Value

A vector of values.

See Also

```
aldex.clr
```

Examples

```
data(selex)
    #subset for efficiency
    selex <- selex[1201:1600,]
conds <- c(rep("NS", 7), rep("S", 7))
x <- aldex.clr(selex, conds, mc.samples = 2, denom = "iqlr", verbose = FALSE)
Denom <- getDenom(x)
# to find the names of housekeeping genes used
getFeatureNames(x)[getDenom(x)]</pre>
```

getFeatureNames

getFeatureNames

Description

Returns the names of the features as a vector, for an aldex.clr object.

Usage

```
getFeatureNames(.object)
```

Arguments

.object

A aldex.clr object containing the Monte Carlo Dirochlet instances derived from estimating the technical variance of the raw read count data, along with sample and feature information.

Details

Returns the names of the keys that can be used to subset the data rows. The keys values are the rsid's.

Value

A vector of feature names.

See Also

```
aldex.clr
```

18 getFeatures

Examples

```
data(selex)
    #subset for efficiency
    selex <- selex[1201:1600,]
conds <- c(rep("NS", 7), rep("S", 7))
x <- aldex.clr(selex, conds, mc.samples = 2, denom="all", verbose = FALSE)
featureNames <- getFeatureNames(x)</pre>
```

getFeatures

getFeatures

Description

Returns the features as a vector, for an aldex.clr object.

Usage

```
getFeatures(.object)
```

Arguments

.object

A aldex.clr object containing the Monte Carlo Dirochlet instances derived from estimating the technical variance of the raw read count data, along with sample and feature information.

Details

Returns the features as a vector, for an aldex.clr object.

Value

A vector of features.

See Also

aldex.clr

```
data(selex)
    #subset for efficiency
    selex <- selex[1201:1600,]
conds <- c(rep("NS", 7), rep("S", 7))
x <- aldex.clr(selex, conds, mc.samples = 2, denom="all", verbose = FALSE)
features <- getFeatures(x)</pre>
```

getMonteCarloInstances

```
getMonteCarloInstances
```

getMonteCarloInstances

Description

Returns the Monte Carlo Dirochlet instances used to create an aldex.clr object.

Usage

```
getMonteCarloInstances(.object)
```

Arguments

.object

A aldex.clr object containing the Monte Carlo Dirochlet instances derived from estimating the technical variance of the raw read count data, along with sample and feature information.

Details

Returns the Monte Carlo Dirochlet instances used to create an aldex.clr object.

Value

A list of data frames of Monte Carlo Dirochlet instances derived from estimating the technical variance of the raw read count data.

See Also

```
aldex.clr
```

Examples

```
data(selex)
    #subset for efficiency
    selex <- selex[1201:1600,]
conds <- c(rep("NS", 7), rep("S", 7))
x <- aldex.clr(selex, conds, mc.samples = 2, denom = "all", verbose = FALSE)
monteCarloInstances <- getMonteCarloInstances(x)</pre>
```

```
getMonteCarloReplicate
```

getMonteCarloReplicate

Description

Returns the designated Monte Carlo Dirochlet replicate generated from analysis, for an aldex.clr object.

20 getReads

Usage

```
getMonteCarloReplicate(.object,i)
```

Arguments

.object A aldex.clr object containing the Monte Carlo Dirochlet instances derived

from estimating the technical variance of the raw read count data, along with

sample and feature information.

i The numeric index of the desired replicate.

Details

Returns the designated Monte Carlo Dirochlet replicate generated from analysis.

Value

A data frame representing the designated Monte Carlo Dirochlet replicate generated from analysis.

See Also

```
aldex.clr
```

Examples

```
data(selex)
    #subset for efficiency
    selex <- selex[1201:1600,]
conds <- c(rep("NS", 7), rep("S", 7))
x <- aldex.clr(selex, conds, mc.samples = 2, denom = "all", verbose = FALSE)
monteCarloInstance <- getMonteCarloReplicate(x,1)</pre>
```

getReads

getReads

Description

Returns the count table used as input for analysis, for an aldex.clr object.

Usage

```
getReads(.object)
```

Arguments

.object

A aldex.clr object containing the Monte Carlo Dirochlet instances derived from estimating the technical variance of the raw read count data, along with sample and feature information.

Details

Returns the count table.

getSampleIDs 21

Value

A data frame representing the count table used as input for analysis.

See Also

```
aldex.clr
```

Examples

```
data(selex)
    #subset for efficiency
    selex <- selex[1201:1600,]
conds <- c(rep("NS", 7), rep("S", 7))
x <- aldex.clr(selex, conds, mc.samples = 2, denom = "all", verbose = FALSE)
reads <- getReads(x)</pre>
```

getSampleIDs

getSampleIDs

Description

Returns the names of the samples for an aldex.clr object. These can be used to access the original reads, as in reads\$sampleID (if the reads are a data frame).

Usage

```
getSampleIDs(.object)
```

Arguments

.object

A aldex.clr object containing the Monte Carlo Dirochlet instances derived from estimating the technical variance of the raw read count data, along with sample and feature information.

Details

Returns the names of the samples. These can be used to access the original reads, as in reads\$sampleID (if the reads are a data frame).

Value

A vector of sample names.

See Also

```
aldex.clr
```

22 numConditions

Examples

```
data(selex)
    #subset for efficiency
    selex <- selex[1201:1600,]
conds <- c(rep("NS", 7), rep("S", 7))
x <- aldex.clr(selex, conds, mc.samples = 2, denom = "all", verbose = FALSE)
sampleIDs <- getSampleIDs(x)</pre>
```

numConditions

numConditions

Description

Returns the number of conditions compared for analysis, for an aldex.clr object.

Usage

```
numConditions(.object)
```

Arguments

.object

A aldex.clr object containing the Monte Carlo Dirochlet instances derived from estimating the technical variance of the raw read count data, along with sample and feature information.

Details

Returns the number of conditions compared.

Value

A numeric representing the number of conditions compared.

See Also

```
aldex.clr
```

```
data(selex)
    #subset for efficiency
    selex <- selex[1201:1600,]
conds <- c(rep("NS", 7), rep("S", 7))
x <- aldex.clr(selex, conds, mc.samples = 2, denom = "all", verbose = FALSE)
conditions <- numConditions(x)</pre>
```

numFeatures 23

numFeatures

numFeatures

Description

Returns the number of features associated with the data, for an aldex.clr object.

Usage

```
numFeatures(.object)
```

Arguments

.object

A aldex.clr object containing the Monte Carlo Dirochlet instances derived from estimating the technical variance of the raw read count data, along with sample and feature information.

Details

Returns the number of features associated with the data.

Value

A numeric representing the number of features associated with the data.

See Also

```
aldex.clr
```

Examples

```
data(selex)
    #subset for efficiency
    selex <- selex[1201:1600,]
conds <- c(rep("NS", 7), rep("S", 7))
x <- aldex.clr(selex, conds, mc.samples = 2, denom = "all", verbose = FALSE)
numFeatures <- numFeatures(x)</pre>
```

numMCInstances

numMCInstances

Description

Returns the number of Monte Carle Dirochlet instances generated for analysis, for an aldex.clr object.

Usage

```
numMCInstances(.object)
```

24 selex

Arguments

.object

A aldex.clr object containing the Monte Carlo Dirochlet instances derived from estimating the technical variance of the raw read count data, along with sample and feature information.

Details

Returns the number of Monte Carle Dirochlet instances generated for analysis.

Value

A numeric representing the number of Monte Carle Dirochlet instances generated for analysis.

See Also

```
aldex.clr
```

Examples

```
data(selex)
    #subset for efficiency
    selex <- selex[1201:1600,]
conds <- c(rep("NS", 7), rep("S", 7))
x <- aldex.clr(selex, conds, mc.samples = 2, denom = "all", verbose = FALSE)
numInstances <- numMCInstances(x)</pre>
```

selex

Selection-based differential sequence variant abundance dataset

Description

This data set gives the differential abundance of 1600 enzyme variants grown under selective (NS) and selective (S) conditions

Usage

selex

Format

A dataframe of 1600 features and 14 samples. The first 7 samples are non-selected, the last 7 are selected.

Source

McMurrough et al (2014) PNAS doi:10.1073/pnas.1322352111

synth2 25

synth2

Synthetic asymmetric dataset

Description

This synthetic dataset contains 2 percent sparsity as 0 values asymmetrically distributed. It is used as a test dataset.

Usage

selex

Format

A dataframe of 1000 features and 16 samples. The first 8 samples contain 20 features set to 0, the last 8 samples contain counts.

Source

Gloor et al (2017) notes
