

# Package ‘dsmSearch’

June 5, 2025

**Type** Package

**Title** DSM and LiDAR downloader

**Version** 1.2.1

**Description** A collection of functions to search and download DSM (Digital Surface Model) and LiDAR (Light Detection and Ranging) data via APIs, including 'OpenTopography' <<https://portal.opentopography.org/apidocs/>> and 'TNMAccess' <<https://apps.nationalmap.gov/tnmaccess/#/>>.

**Depends** R (>= 4.1)

**License** GPL-3

**Encoding** UTF-8

**RoxygenNote** 7.3.1

**Language** en-US

**Suggests** testthat (>= 3.0.0), knitr, rmarkdown

**VignetteBuilder** knitr, rmarkdown

**Imports** dplyr, sf, sp, terra, lidR, httr2, forestdata, nominatimlite, imager

**NeedsCompilation** no

**Author** Xiaohao Yang [aut, cre, cph],  
Nathan Fox [aut],  
Derek Van Berkel [aut],  
Mark Lindquist [aut]

**Maintainer** Xiaohao Yang <xiaohaoy@umich.edu>

**Repository** CRAN

**Date/Publication** 2025-06-05 21:40:02 UTC

 get\_dsm\_30
 

---

## Description

Search for and download Digital Surface Model based on coordinates of a spatial point with a given distance or bounding box. The resolution of AW3D30 (ALOS World 3D 30m) and SRTMGL1 (SRTM GL1 30m) raster is 30 meter. The raster resolutions of USGS datasets are 10m and 1m. Forest canopy height maps (CHM) include the ETH Global Sentinel-2 10m Canopy Height (2020) and the Meta High Resolution 1m Global Canopy Height Map

## Usage

```
get_dsm_30(x, y, r, epsg, bbox, datatype = "AW3D30", key = "")
```

## Arguments

x	numeric, indicating Longitude degree of the center point. (bbox is specified, this argument is ignored)
y	numeric, indicating latitude degree of the center point. (bbox is specified, this argument is ignored)
r	numeric, indicating search distance (meter or feet) for LiDAR data. (bbox is specified, this argument is ignored)
epsg	numeric, the EPSG code specifying the coordinate reference system. (bbox is specified, this argument is ignored)
bbox	vector, a bounding box defining the geographical area for downloading data.
datatype	character, dataset names including "AW3D30", "SRTMGL1", "USGS1m", "USGS10m", "metaCHM", and "ethCHM".
key	character, API key of OpenTopography. (not required for "metaCHM", and "ethCHM")

## Details

To request an API key of OpenTopography, [online registration](#) is needed.

To get CHMs with more customized arguments please use `fd_canopy_height` from the `forestdata` package.

Data may be freely used for academic purposes, but be cited appropriately (see references below).

## Value

SpatRaster raster

## Examples

```
## Not run:
data <- dsmSearch::get_dsm_30(bbox = c(-83.783557, 42.241833, -83.696525, 42.310420),
                             key = "API key")
data <- dsmSearch::get_dsm_30(x = -83.741289,
                             y = 42.270146,
                             r = 1000,
                             epsg = 2253,
                             key = "API key")

## End(Not run)
```

---

get\_lidar

*get\_lidar*

---

## Description

Search for and download LiDAR data based on coordinates of a spatial point with a given distance or a bounding box. The maximum distance is 1000m. Different dataset could be found and the function automatically downloads the latest dataset. To get more details of data on a larger scale, please use `viewscape::lidar_search`.

## Usage

```
get_lidar(x, y, r, epsg, bbox, max_return = 1000, folder)
```

**Arguments**

x	numeric, indicating Longitude degree of the center point.
y	numeric, indicating latitude degree of the center point.
r	numeric, indicating search distance for LiDAR data. The maximum distance is 1000m (3281ft). If $r > 1000m$ , it will be reset to 1000m.
epsg	numeric, the EPSG code specifying the coordinate reference system.
bbox	vector, a bounding box defining the geographical area for downloading data.
max_return	numeric, indicating the maximum of returns.
folder	string (optional), indicating a path for downloading the LiDAR data

**Value**

lidR LAS object.

[lidar\\_search\(\)](#)

**Examples**

```
las <- dsmSearch::get_lidar(x = -83.741289, y = 42.270146, r = 1000, epsg = 2253)
las <- dsmSearch::get_lidar(bbox = c(-83.742282, 42.273389, -83.733442, 42.278724), epsg = 2253)

if (inherits(las, "LAS")) {
  can <- lidR::rasterize_canopy(las, 10, lidR::dsmtin())
  terra::plot(can)
} else {
  message("No LAS object returned. Skipping rasterization.")
}
```

---

lidar\_search

*lidar\_search*

---

**Description**

The `lidar_search` function is designed to facilitate the retrieval and exploration of LiDAR (Light Detection and Ranging) data within a specified bounding box (`bbox`). This function enables users to search for LiDAR data, preview available graphics, and optionally download LiDAR data files for further analysis.
