

Package ‘mpoly’

June 9, 2025

Type Package

Title Symbolic Computation and More with Multivariate Polynomials

Version 1.1.2

URL <https://github.com/dkahle/mpoly>

BugReports <https://github.com/dkahle/mpoly/issues>

Description Symbolic computing with multivariate polynomials in R.

Imports stringr (>= 1.0.0), stringi, partitions, plyr, stats, ggplot2,
polynom, orthopolynom, tidyr

Suggests testthat (>= 2.1.0), magrittr, dplyr, covr

License GPL-2

RoxygenNote 7.3.2

Encoding UTF-8

NeedsCompilation no

as-function

Change polynomials into functions.

Description

Transform `mpoly` and `mpolyList` objects into function that can be evaluated.

Usage

```
## S3 method for class 'mpoly'
as.function(x, varorder = vars(x), vector = TRUE,
            silent = FALSE, ..., plus_pad = 1L, times_pad = 1L, squeeze = TRUE)

## S3 method for class 'bernstein'
as.function(x, ...)

## S3 method for class 'mpolyList'
as.function(x, varorder = vars(x), vector = TRUE,
            silent = FALSE, name = FALSE, ..., plus_pad = 1L, times_pad = 1L, squeeze = TRUE)

## S3 method for class 'bezier'
as.function(x, ...)
```

Arguments

<code>x</code>	an object of class <code>mpoly</code>
<code>varorder</code>	the order of the variables
<code>vector</code>	whether the function should take a vector argument (TRUE) or a series of arguments (FALSE)
<code>silent</code>	logical; if TRUE, suppresses output
<code>...</code>	any additional arguments
<code>plus_pad</code>	number of spaces to the left and right of plus sign
<code>times_pad</code>	number of spaces to the left and right of times sign
<code>squeeze</code>	minify code in the created function
<code>name</code>	should the returned object be named? only for <code>mpolyList</code> objects

Details

Convert polynomials to functions mapping R^n to R^m that are vectorized in the following way
`as.function.mpoly()` governs this behavior:

[$m = 1, n = 1$, e.g. $f(x) = x^2 + 2x$] Ordinary vectorized function returned, so that if you input a numeric vector x , the returned function is evaluated at each of the input values, and a numeric vector is returned.

[$m = 1, n = 2+$, e.g. $f(x,y) = x^2 + 2x + 2xy$] A function of a single vector argument $f(v) = f(c(x,y))$ is returned. If a $N \times n$ matrix is input to the returned function, the function will be applied across the rows and return a numeric vector of length N . If desired, setting `vector = FALSE` changes this behavior so that an arity- n function is returned, i.e. the function $f(x,y)$ of two arguments. In this case, the returned function will accept equal-length numeric vectors and return a numeric vector, vectorizing it.

And `as.function.mpolyList()` governs this behavior:

[m = 2+, n = 1, e.g. f(x) = (x, x^2)] Ordinary vectorized function returned, so that if you input a numeric vector x, the function is evaluated at each of the input values, and a numeric matrix N x m, where N is the length of the input vector.

[m = 2+, n = 2+, e.g. f(x,y) = (1, x, y)] When vector = FALSE (the default), the created function accepts a numeric vector and returns a numeric vector. The function will also accept an N x n matrix, in which case the function is applied to its rows to return a N x m matrix.

Examples

```
# basic usage. m = # polys/eqns, n = # vars

# m = 1, n = 1, `as.function.mpoly()`-
p <- mp("x^2 + 1")
(f <- as.function(p))
f(2)
f(1:3) # vectorized

# m = 1, n = 2 , `as.function.mpoly()`-
p <- mp("x y")
(f <- as.function(p))
f(1:2)
(mat <- matrix(1:6, ncol = 2))
f(mat) # vectorized across rows of input matrix

# m = 2, n = 1, `as.function.mpolyList()`-
p <- mp(c("x", "x^2"))
(f <- as.function(p))
f(2)
f(1:3) # vectorized

(f <- as.function(p, name = TRUE))
f(2)
f(1:3) # vectorized

# m = 3, n = 2, `as.function.mpolyList()`-
p <- mp("(x + y)^2")
(p <- monomials(p))

(f <- as.function(p))
f(1:2)
(mat <- cbind(x = 1:3, y = 4:6))
f(mat) # vectorized across rows of input matrix

(f <- as.function(p, name = TRUE))
f(1:2)
```

```

f(mat)

# setting vector = FALSE changes the function to a sequence of arguments
# this is only of interest if n = # of vars > 1

# m = 1, n = 2, `as.function.mpoly()`
p <- mp("x y")
(f <- as.function(p, vector = FALSE))
f(1, 2)
(mat <- matrix(1:6, ncol = 2))

```

as.mpoly*Convert an object to an mpoly*

Description

mpoly is the most basic function used to create objects of class mpoly.

Usage

```
as.mpoly(x, ...)
```

Arguments

x	an object
...	additional arguments to pass to methods

Value

the object formated as a mpoly object.

Author(s)

David Kahle <david@kahle.io>

See Also

[mp\(\)](#)

Examples

```
library(ggplot2); theme_set(theme_classic())
library(dplyr)

n <- 101
s <- seq(-5, 5, length.out = n)

# one dimensional case

df <- data.frame(x = seq(-5, 5, length.out = n)) %>%
  mutate(y = -x^2 + 2*x - 3 + rnorm(n, 0, 2))

(mod <- lm(y ~ x + I(x^2), data = df))
(p <- as.mpoly(mod))
qplot(x, y, data = df) +
  stat_function(fun = as.function(p), colour = "red", size = 1)

(mod <- lm(y ~ poly(x, 2, raw = TRUE), data = df))
```

```
(p <- as.mpoly(mod))
qplot(x, y, data = df) +
  stat_function(fun = as.function(p), colour = "red", size = 1)

(mod <- lm(y ~ poly(x, 1, raw = TRUE), data = df))
(p <- as.mpoly(mod))
qplot(x, y, data = df) +
  stat_function(fun = as.function(p), colour = "red", size = 1)

# two dimensional case with ggplot2

df <- expand.grid(x = s, y = s) %>%
  mutate(z = x^2 - y^2 + 3*x*y + rnorm(n^2, 0, 3))
qplot(x, y, data = df, geom = "raster", fill = z)

(mod <- lm(z ~ x + y + I(x^2) + I(y^2) + I(x*y), data = df))
(mod <- lm(z ~ poly(x, y, degree = 2, raw = TRUE), data = df))
(p <- as.mpoly(mod))
df$fit <- apply(df[,c("x","y")], 1, as.function(p))

qplot(x, y, data = df, geom = "raster", fill = fit)
qplot(x, y, data = df, geom = "raster", fill = z - fit) # residuals
```

basis_monomials *Enumerate basis monomials*

Description

Enumerate basis monomials in the standard basis up to a given degree.

Usage

```
basis_monomials(indeterminates, d)
```

Arguments

indeterminates	a character vector
d	the highest total degree

Value

a [mpolyList\(\)](#) object of monomials

Examples

```
basis_monomials(c("x", "y"), 2)
basis_monomials(c("x", "y"), 3)
basis_monomials(c("x", "y", "z"), 2)
basis_monomials(c("x", "y", "z"), 3)
```

bernstein

Bernstein polynomials

Description

Bernstein polynomials

Usage

```
bernstein(k, n, indeterminate = "x")
```

Arguments

k	Bernstein polynomial k
n	Bernstein polynomial degree
indeterminate	indeterminate

Value

a mpoly object

Author(s)

David Kahle

Examples

```
bernstein(0, 0)

bernstein(0, 1)
bernstein(1, 1)

bernstein(0, 1, "t")

bernstein(0:2, 2)
bernstein(0:3, 3)
bernstein(0:3, 3, "t")
```

```

bernstein(0:4, 4)
bernstein(0:10, 10)
bernstein(0:10, 10, "t")
bernstein(0:20, 20, "t")

## Not run: # visualize the bernstein polynomials

library(ggplot2); theme_set(theme_classic())
library(tidyverse)

s <- seq(0, 1, length.out = 101)
N <- 10 # number of bernstein polynomials to plot
(bernPolys <- bernstein(0:N, N))

df <- data.frame(s, as.function(bernPolys)(s))
names(df) <- c("x", paste0("B_", 0:N))
head(df)

mdf <- gather(df, degree, value, -x)
head(mdf)

qplot(x, value, data = mdf, geom = "line", color = degree)

## End(Not run)

```

bernstein-approx *Bernstein polynomial approximation*

Description

Bernstein polynomial approximation

Usage

```

bernstein_approx(f, n, lower = 0, upper = 1, indeterminate = "x")
bernsteinApprox(...)

```

Arguments

f	the function to approximate
n	Bernstein polynomial degree
lower	lower bound for approximation
upper	upper bound for approximation

```
indeterminate  indeterminate
...
...
```

Value

a mpoly object

Author(s)

David Kahle

Examples

```
## Not run: # visualize the bernstein polynomials

library(ggplot2); theme_set(theme_bw())
library(reshape2)

f <- function(x) sin(2*pi*x)
p <- bernstein_approx(f, 20)
round(p, 3)

x <- seq(0, 1, length.out = 101)
df <- data.frame(
  x = rep(x, 2),
  y = c(f(x), as.function(p)(x)),
  which = rep(c("actual", "approx"), each = 101)
)
qplot(x, y, data = df, geom = "line", color = which)

p <- bernstein_approx(sin, 20, pi/2, 1.5*pi)
round(p, 4)

x <- seq(0, 2*pi, length.out = 101)
df <- data.frame(
  x = rep(x, 2),
  y = c(sin(x), as.function(p)(x)),
  which = rep(c("actual", "approx"), each = 101)
)
qplot(x, y, data = df, geom = "line", color = which)
```

```

p <- bernstein_approx(dnorm, 15, -1.25, 1.25)
round(p, 4)

x <- seq(-3, 3, length.out = 101)
df <- data.frame(
  x = rep(x, 2),
  y = c(dnorm(x), as.function(p)(x)),
  which = rep(c("actual", "approx"), each = 101)
)
qplot(x, y, data = df, geom = "line", color = which)

## End(Not run)

```

bezier*Bezier polynomials***Description**

Compute the Bezier polynomials of a given collection of points. Note that using [as.function.mpoly\(\)](#) on the resulting Bezier polynomials is made numerically stable by taking advantage of de Casteljau's algorithm; it does not use the polynomial that is printed to the screen. See [bezier_function\(\)](#) for details.

Usage

```
bezier(..., indeterminate = "t")
```

Arguments

- ... either a sequence of points or a matrix/data frame of points, see examples
- indeterminate the indeterminate of the resulting polynomial

Value

a mpoly object

Author(s)

David Kahle

See Also[bezier_function\(\)](#)**Examples**

```
p1 <- c(0, 0)
p2 <- c(1, 1)
p3 <- c(2, -1)
p4 <- c(3, 0)
bezier(p1, p2, p3, p4)
```

```
points <- data.frame(x = 0:3, y = c(0,1,-1,0))
bezier(points)
```

```
points <- data.frame(x = 0:2, y = c(0,1,0))
bezier(points)
```

```
# visualize the bernstein polynomials

library(ggplot2); theme_set(theme_bw())
s <- seq(0, 1, length.out = 101)

## example 1
points <- data.frame(x = 0:3, y = c(0,1,-1,0))
(bezPolys <- bezier(points))

f <- as.function(bezPolys)
df <- as.data.frame(f(s))

ggplot(aes(x = x, y = y), data = df) +
  geom_point(data = points, color = "red") +

  geom_point(data = points, color = "red") +
  geom_path(data = points, color = "red") +
  geom_path()
```

```

## example 5
qplot(speed, dist, data = cars)

s <- seq(0, 1, length.out = 201)
p <- bezier(cars)
f <- as.function(p)
df <- as.data.frame(f(s))
qplot(speed, dist, data = cars) +
  geom_path(data = df, color = "red")

# the curve is not invariant to permutations of the points
# but it always goes through the first and last points
permute_rows <- function(df) df[sample(nrow(df)),]
p <- bezier(permute_rows(cars))
f <- as.function(p)
df <- as.data.frame(f(s))
qplot(speed, dist, data = cars) +
  geom_path(data = df, color = "red")

```

bezier_function*Bezier function***Description**

Compute the Bezier function of a collection of polynomials. By Bezier function we mean the Bezier curve function, a parametric map running from $t = 0$, the first point, to $t = 1$, the last point, where the coordinate mappings are linear combinations of Bernstein polynomials.

Usage

```

bezier_function(points, weights = rep(1L, nrow(points)))
bezierFunction(...)

```

Arguments

- | | |
|----------------------|--|
| <code>points</code> | a matrix or data frame of numerics. the rows represent points. |
| <code>weights</code> | the weights in a weighted Bezier curve |
| <code>...</code> | ...; used internally |

Details

The function returned is vectorized and evaluates the Bezier curve in a numerically stable way with de Castlejau's algorithm (implemented in R).

Value

function of a single parameter

Author(s)

David Kahle

```

burst*Enumerate integer r-vectors summing to n*

Description

Determine all r-vectors with nonnegative integer entries summing to n. Note that this is not intended to be optimized.

Usage

```
burst(n, r = n)
```

Arguments

n	integer to sum to
r	number of components

Value

a matrix whose rows are the n-tuples

Examples

```
burst(3)  
  
burst(3, 1)  
burst(3, 2)  
burst(3, 3)  
burst(3, 4)  
  
rowSums(burst(4))  
rowSums( burst(3, 2) )  
rowSums( burst(3, 3) )  
rowSums( burst(3, 4) )
```

```
burst(10, 4) # all possible 2x2 contingency tables with n=10
burst(10, 4) / 10 # all possible empirical relative frequencies
```

chebyshev*Chebyshev polynomials***Description**

Chebyshev polynomials as computed by orthopolynom.

Usage

```
chebyshev(degree, kind = "t", indeterminate = "x", normalized = FALSE)
chebyshev_roots(k, n)
```

Arguments

<code>degree</code>	degree of polynomial
<code>kind</code>	"t" or "u" (Chebyshev polynomials of the first and second kinds), or "c" or "s"
<code>indeterminate</code>	indeterminate
<code>normalized</code>	provide normalized coefficients
<code>k, n</code>	the k'th root of the n'th chebyshev polynomial

Value

a mpoly object or mpolyList object

Author(s)

David Kahle calling code from the orthopolynom package

```

components*Polynomial components***Description**

Compute quantities/expressions related to a multivariate polynomial.

Usage

```
## S3 method for class 'mpoly'
x[ndx]

LT(x, varorder = vars(x), order = "lex")

LC(x, varorder = vars(x), order = "lex")

LM(x, varorder = vars(x), order = "lex")

multideg(x, varorder = vars(x), order = "lex")

totaldeg(x)

monomials(x, unit = FALSE)

exponents(x, reduced = FALSE)

## S3 method for class 'mpoly'
coef(object, ...)

normalize_coefficients(p, norm = function(x) sqrt(sum(x^2)))

coef_lift(p)
```

Arguments

<code>x</code>	an object of class <code>mpoly</code>
<code>ndx</code>	a subsetting index
<code>varorder</code>	the order of the variables
<code>order</code>	a total order used to order the terms
<code>unit</code>	for <code>monomials()</code> , should the monomials have coefficient 1?

reduced	if TRUE, don't include zero degrees
object	mpoly object to pass to <code>coef()</code>
...	In <code>coef()</code> , additional arguments passed to <code>print.mpoly()</code> for the names of the resulting vector
p	an object of class mpoly or mpolyList
norm	a norm (function) to normalize the coefficients of a polynomial, defaults to the Euclidean norm

Value

An object of class mpoly or mpolyList, depending on the context

Examples

```
(p <- mp("x y^2 + x (x+1) (x+2) x z + 3 x^10"))
p[2]
p[-2]
p[2:3]

LT(p)
LC(p)
LM(p)

multideg(p)
totaldeg(p)
monomials(p)
monomials(p, unit = TRUE)
coef(p)

p[1:2]
coef_lift(p[1:2])

exponents(p)
exponents(p, reduce = TRUE)
lapply(exponents(p), is.integer)

homogeneous_components(p)

(p <- mp("(x + y)^2"))
normalize_coefficients(p)
norm <- function(v) sqrt(sum(v^2))
norm(coef(normalize_coefficients(p)))

abs_norm <- function(x) sum(abs(x))
normalize_coefficients(p, norm = abs_norm)

p <- mp(c("x", "2 y"))
normalize_coefficients(p)

# normalize_coefficients on the zero polynomial returns the zero polynomial
normalize_coefficients(mp("0"))
```

deriv.mpoly*Compute partial derivatives of a multivariate polynomial.***Description**

This is a deriv method for mpoly objects. It does not call the `stats::deriv()`.

Usage

```
## S3 method for class 'mpoly'
deriv(expr, var, ..., bring_power_down = TRUE)
```

Arguments

<code>expr</code>	an object of class mpoly
<code>var</code>	character - the partial derivative desired
<code>...</code>	any additional arguments
<code>bring_power_down</code>	if FALSE, $x^n \rightarrow x^{(n-1)}$, not $n x^{(n-1)}$

Value

An object of class mpoly or mpolyList.

Examples

```
p <- mp("x y + y z + z^2")
deriv(p, "x")
deriv(p, "y")
deriv(p, "z")
deriv(p, "t")
deriv(p, c("x", "y", "z"))

is.mpoly(deriv(p, "x"))
is.mpolyList( deriv(p, c("x", "y", "z")) )

p <- mp("x^5")
deriv(p, "x")
deriv(p, "x", bring_power_down = FALSE)
```

`eq_mp`*Convert an equation to a polynomial*

Description

Convert characters of the form "`p1 = p2`" (or similar) to an mpoly object representing `p1 - p2`.

Usage

```
eq_mp(string, ...)
```

Arguments

<code>string</code>	a character string containing a polynomial, see examples
<code>...</code>	arguments to pass to mpoly()

Value

An object of class mpoly or mpolyList.

Author(s)

David Kahle <david@kahle.io>

See Also

[mpoly\(\)](#)

Examples

```
eq_mp(c("y = x", "y == (x + 2)"))
```

`gradient`*Compute gradient of a multivariate polynomial.*

Description

This is a wrapper for deriv.mpoly.

Usage

```
gradient(mpoly)
```

Arguments

`mpoly` an object of class `mpoly`

Value

An object of class `mpoly` or `mpolyList`.

See Also

[deriv.mpoly\(\)](#)

Examples

```
m <- mp("x y + y z + z^2")
gradient(m)

# gradient descent illustration using the symbolically
# computed gradient of the rosenbrock function (shifted)
rosenbrock <- mp("(1 - x)^2 + 100 (y - x^2)^2")
fn <- as.function(rosenbrock)
(rosenbrock_gradient <- gradient(rosenbrock))
gr <- as.function(rosenbrock_gradient)

# visualize the function
library(ggplot2)
s <- seq(-5, 5, .05)
df <- expand.grid(x = s, y = s)
df$z <- apply(df, 1, fn)
ggplot(df, aes(x = x, y = y)) +
  geom_raster(aes(fill = z + 1e-10)) +
  scale_fill_continuous(trans = "log10")

# run the gradient descent algorithm using line-search
# step sizes computed with optimize()
current <- steps <- c(-3,-4)
change <- 1
tol <- 1e-5
while(change > tol){
  last <- current
  delta <- optimize(
    function(delta) fn(current - delta*gr(current)),
    interval = c(1e-10, .1)
  )$minimum
  current <- current - delta*gr(current)
  steps <- unname(rbind(steps, current))
  change <- abs(fn(current) - fn(last))
}
steps <- as.data.frame(steps)
names(steps) <- c("x", "y")

# visualize steps, note the optim at c(1,1)
```

```

# the routine took 5748 steps
ggplot(df, aes(x = x, y = y)) +
  geom_raster(aes(fill = z + 1e-10)) +
  geom_path(data = steps, color = "red") +
  geom_point(data = steps, color = "red", size = .5) +
  scale_fill_continuous(trans = "log10")

# it gets to the general region of space quickly
# but once it gets on the right arc, it's terrible
# here's what the end game looks like
last_steps <- tail(steps, 100)
rngx <- range(last_steps$x); sx <- seq(rngx[1], rngx[2], length.out = 201)
rngy <- range(last_steps$y); sy <- seq(rngy[1], rngy[2], length.out = 201)
df <- expand.grid(x = sx, y = sy)
df$z <- apply(df, 1, fn)
ggplot(df, aes(x = x, y = y)) +
  geom_raster(aes(fill = z)) +
  geom_path(data = last_steps, color = "red", size = .25) +
  geom_point(data = last_steps, color = "red", size = 1) +
  scale_fill_continuous(trans = "log10")

```

hermite*Hermite polynomials***Description**

Hermite polynomials as computed by orthopolynom.

Usage

```
hermite(degree, kind = "he", indeterminate = "x", normalized = FALSE)
```

Arguments

<code>degree</code>	degree of polynomial
<code>kind</code>	"he" (default, probabilists', see Wikipedia article) or "h" (physicists)
<code>indeterminate</code>	indeterminate
<code>normalized</code>	provide normalized coefficients

Value

a mpoly object or mpolyList object

Author(s)

David Kahle calling code from the orthopolynom package

See Also

[orthopolynom::hermite.h.polynomials\(\)](#), [orthopolynom::hermite.he.polynomials\(\)](#), https://en.wikipedia.org/wiki/Hermite_polynomials

Examples

```

hermite(0)
hermite(1)
hermite(2)
hermite(3)
hermite(4)
hermite(5)
hermite(6)
hermite(10)

hermite(0:5)
hermite(0:5, normalized = TRUE)
hermite(0:5, indeterminate = "t")

# visualize the hermite polynomials

library(ggplot2); theme_set(theme_classic())
library(tidyr)

s <- seq(-3, 3, length.out = 201)
N <- 5 # number of hermite polynomials to plot
(hermPolys <- hermite(0:N))

# see ?bernstein for a better understanding of
# how the code below works

df <- data.frame(s, as.function(hermPolys)(s))
names(df) <- c("x", paste0("T_", 0:N))
mdf <- gather(df, degree, value, -x)
qplot(x, value, data = mdf, geom = "line", color = degree)

# hermite polynomials are orthogonal with respect to the gaussian kernel:
He2 <- as.function(hermite(2))
He3 <- as.function(hermite(3))
He4 <- as.function(hermite(4))

w <- dnorm
integrate(function(x) He2(x) * He3(x) * w(x), lower = -Inf, upper = Inf)
integrate(function(x) He2(x) * He4(x) * w(x), lower = -Inf, upper = Inf)
integrate(function(x) He3(x) * He4(x) * w(x), lower = -Inf, upper = Inf)

```

homogenize	<i>Homogenize a polynomial</i>
------------	--------------------------------

Description

Homogenize a polynomial.

Usage

```
homogenize(x, indeterminate = "t")
dehomogenize(x, indeterminate = "t")
is.homogeneous(x)
homogeneous_components(x)
```

Arguments

x	an mpoly object, see mpoly()
indeterminate	name of homogenization

Value

a (de/homogenized) mpoly or an mpolyList

Examples

```
x <- mp("x^4 + y + 2 x y^2 - 3 z")
is.homogeneous(x)
(xh <- homogenize(x))
is.homogeneous(xh)

homogeneous_components(x)

homogenize(x, "o")

xh <- homogenize(x)
dehomogenize(xh) # assumes indeterminate = "t"
plug(xh, "t", 1) # same effect, but dehomogenize is faster

# the functions are vectorized
(ps <- mp(c("x + y^2", "x + y^3")))
(psh <- homogenize(ps))
dehomogenize(psh)
```

```
# demonstrating a leading property of homogeneous polynomials
library(magrittr)
p <- mp("x^2 + 2 x + 3")
(ph <- homogenize(p, "y"))
lambda <- 3
(d <- totaldeg(p))
ph %>%
  plug("x", lambda*mp("x")) %>%
  plug("y", lambda*mp("y"))
lambda^d * ph
```

insert*Insert an element into a vector.***Description**

Insert an element into a vector.

Usage

```
insert(elem, slot, v)
```

Arguments

elem	element to insert
slot	location of insert
v	vector to insert into

Value

vector with element inserted

Examples

```
insert(2, 1, 1)
insert(2, 2, 1)
insert('x', 5, letters)
```

is.wholenumber	<i>Test whether an object is a whole number</i>
----------------	---

Description

Test whether an object is a whole number.

Usage

```
is.wholenumber(x, tol = .Machine$double.eps^0.5)
```

Arguments

x	object to be tested
tol	tolerance within which a number is said to be whole

Value

Vector of logicals.

Examples

```
is.wholenumber(seq(-3,3,.5))
```

jacobi	<i>Jacobi polynomials</i>
--------	---------------------------

Description

Jacobi polynomials as computed by orthopolynom.

Usage

```
jacobi(  
  degree,  
  alpha = 1,  
  beta = 1,  
  kind = "p",  
  indeterminate = "x",  
  normalized = FALSE  
)
```

Arguments

degree	degree of polynomial
alpha	the first parameter, also called p
beta	the second parameter, also called q
kind	"g" or "p"
indeterminate	indeterminate
normalized	provide normalized coefficients

Value

a mpoly object or mpolyList object

Author(s)

David Kahle calling code from the orthopolynom package

See Also

[orthopolynom::jacobi.g.polynomials\(\)](#), [orthopolynom::jacobi.p.polynomials\(\)](#), https://en.wikipedia.org/wiki/Jacobi_polynomials

Examples

```

jacobi(0)
jacobi(1)
jacobi(2)
jacobi(3)
jacobi(4)
jacobi(5)
jacobi(6)
jacobi(10, 2, 2, normalized = TRUE)

jacobi(0:5)
jacobi(0:5, normalized = TRUE)
jacobi(0:5, kind = "g")
jacobi(0:5, indeterminate = "t")

# visualize the jacobi polynomials

library(ggplot2); theme_set(theme_classic())
library(tidyr)

s <- seq(-1, 1, length.out = 201)
N <- 5 # number of jacobi polynomials to plot
(jacPolys <- jacobi(0:N, 2, 2))

df <- data.frame(s, as.function(jacPolys)(s))
names(df) <- c("x", paste0("P_", 0:N))

```

```
mdf <- gather(df, degree, value, -x)
qplot(x, value, data = mdf, geom = "line", color = degree)

qplot(x, value, data = mdf, geom = "line", color = degree) +
  coord_cartesian(ylim = c(-30, 30))
```

laguerre*Generalized Laguerre polynomials*

Description

Generalized Laguerre polynomials as computed by orthopolynom.

Usage

```
laguerre(degree, alpha = 0, indeterminate = "x", normalized = FALSE)
```

Arguments

degree	degree of polynomial
alpha	generalization constant
indeterminate	indeterminate
normalized	provide normalized coefficients

Value

a mpoly object or mpolyList object

Author(s)

David Kahle calling code from the orthopolynom package

See Also

[orthopolynom:::glaguerre.polynomials\(\)](#), https://en.wikipedia.org/wiki/Laguerre_polynomials

Examples

```
laguerre(0)
laguerre(1)
laguerre(2)
laguerre(3)
laguerre(4)
laguerre(5)
laguerre(6)
```

```

laguerre(2)
laguerre(2, normalized = TRUE)

laguerre(0:5)
laguerre(0:5, normalized = TRUE)
laguerre(0:5, indeterminate = "t")

# visualize the laguerre polynomials

library(ggplot2); theme_set(theme_classic())
library(tidyverse)

s <- seq(-5, 20, length.out = 201)
N <- 5 # number of laguerre polynomials to plot
(lagPolys <- laguerre(0:N))

# see ?bernstein for a better understanding of
# how the code below works

df <- data.frame(s, as.function(lagPolys)(s))
names(df) <- c("x", paste0("L_", 0:N))
mdf <- gather(df, degree, value, -x)
qplot(x, value, data = mdf, geom = "line", color = degree)

qplot(x, value, data = mdf, geom = "line", color = degree) +
  coord_cartesian(ylim = c(-25, 25))

# laguerre polynomials are orthogonal with respect to the exponential kernel:
L2 <- as.function(laguerre(2))
L3 <- as.function(laguerre(3))
L4 <- as.function(laguerre(4))

w <- dexp
integrate(function(x) L2(x) * L3(x) * w(x), lower = 0, upper = Inf)
integrate(function(x) L2(x) * L4(x) * w(x), lower = 0, upper = Inf)
integrate(function(x) L3(x) * L4(x) * w(x), lower = 0, upper = Inf)

```

Description

A simple algorithm to compute the least common multiple of two numbers

Usage

```
LCM(x, y)
```

Arguments

x	an object of class numeric
y	an object of class numeric

Value

The least common multiple of x and y.

Examples

```
LCM(5,7)
LCM(5,8)
LCM(5,9)
LCM(5,10)
Reduce(LCM, 1:10) # -> 2520
```

legendre

Legendre polynomials

Description

Legendre polynomials as computed by orthopolynom.

Usage

```
legendre(degree, indeterminate = "x", normalized = FALSE)
```

Arguments

degree	degree of polynomial
indeterminate	indeterminate
normalized	provide normalized coefficients

Value

a mpoly object or mpolyList object

Author(s)

David Kahle calling code from the orthopolynom package

See Also

[orthopolynom::legendre.polynomials\(\)](#), https://en.wikipedia.org/wiki/Legendre_polynomials

Examples

```

legendre(0)
legendre(1)
legendre(2)
legendre(3)
legendre(4)
legendre(5)
legendre(6)

legendre(2)
legendre(2, normalized = TRUE)

legendre(0:5)
legendre(0:5, normalized = TRUE)
legendre(0:5, indeterminate = "t")

# visualize the legendre polynomials

library(ggplot2); theme_set(theme_classic())
library(tidyr)

s <- seq(-1, 1, length.out = 201)
N <- 5 # number of legendre polynomials to plot
(legPolys <- legendre(0:N))

# see ?bernstein for a better understanding of
# how the code below works

df <- data.frame(s, as.function(legPolys)(s))

mdf <- gather(df, degree, value, -x)
qplot(x, value, data = mdf, geom = "line", color = degree)

# legendre polynomials and the QR decomposition
n <- 201
x <- seq(-1, 1, length.out = n)
mat <- cbind(1, x, x^2, x^3, x^4, x^5)
Q <- qr.Q(qr(mat))
df <- as.data.frame(cbind(x, Q))
names(df) <- c("x", 0:5)
mdf <- gather(df, degree, value, -x)
qplot(x, value, data = mdf, geom = "line", color = degree)

Q <- apply(Q, 2, function(x) x / x[n])
df <- as.data.frame(cbind(x, Q))
names(df) <- c("x", paste0("P_", 0:5))
mdf <- gather(df, degree, value, -x)
qplot(x, value, data = mdf, geom = "line", color = degree)

```

```

# chebyshev polynomials are orthogonal in two ways:
P2 <- as.function(legendre(2))
P3 <- as.function(legendre(3))
P4 <- as.function(legendre(4))

integrate(function(x) P2(x) * P3(x), lower = -1, upper = 1)
integrate(function(x) P2(x) * P4(x), lower = -1, upper = 1)
integrate(function(x) P3(x) * P4(x), lower = -1, upper = 1)

n <- 10000L
u <- runif(n, -1, 1)
2 * mean(P2(u) * P3(u))
2 * mean(P2(u) * P4(u))
2 * mean(P3(u) * P4(u))

(2/n) * sum(P2(u) * P3(u))
(2/n) * sum(P2(u) * P4(u))
(2/n) * sum(P3(u) * P4(u))

```

lissajous*Lissajous polynomials***Description**

The Lissajous polynomials are the implicit (variety) descriptions of the image of the parametric map $x = \cos(m t + p)$, $y = \sin(n t + q)$.

Usage

```
lissajous(m, n, p, q, digits = 3)
```

Arguments

<code>m, n, p, q</code>	Trigonometric coefficients, see examples for description
<code>digits</code>	The number of digits to round coefficients to, see round.mpoly() . This is useful for cleaning terms that are numerically nonzero, but should be.

Value

a mpoly object

See Also

[chebyshev\(\)](#), Merino, J. C (2003). Lissajous figures and Chebyshev polynomials. The College Mathematics Journal, 34(2), pp. 122-127.

Examples

```
lissajous(3, 2, -pi/2, 0)
lissajous(4, 3, -pi/2, 0)
```

mp

Define a multivariate polynomial.

Description

`mp` is a smart function which attempts to create a formal `mpoly` object from a character string containing the usual representation of a multivariate polynomial.

Usage

```
make_indeeterminate_list(vars)

mp(string, varorder, stars_only = FALSE)
```

Arguments

<code>vars</code>	a character vector of indeterminates
<code>string</code>	a character string containing a polynomial, see examples
<code>varorder</code>	(optional) order of variables in string
<code>stars_only</code>	if you format your multiplications using asterisks, setting this to TRUE will reduce preprocessing time

Value

An object of class `mpoly`.

Author(s)

David Kahle <david@kahle.io>

See Also

[mpoly\(\)](#)

Examples

```
( m <- mp("x + y + x y") )
is.mpoly( m )
unclass(m)

mp("1 + x")

mp("x + 2 y + x^2 y + x y z")
mp("x + 2 y + x^2 y + x y z", varorder = c("y", "z", "x"))

( ms <- mp(c("x + y", "2 x")) )
is.mpolyList(ms)

gradient( mp("x + 2 y + x^2 y + x y z") )
gradient( mp("(x + y)^10") )

# mp and the print methods are kinds of inverses of each other
( polys <- mp(c("x + y", "x - y")) )
strings <- print(polys, silent = TRUE)
strings
mp(strings)
```

Description

This is a list of past functions of the mpoly package.

Details

The following are defunct mpoly functions:

- grobner

Description

Determine whether two multivariate polynomials are equal.

Usage

```
## S3 method for class 'mpoly'
e1 == e2

## S3 method for class 'mpoly'
e1 != e2
```

Arguments

e1	an object of class mpoly
e2	an object of class mpoly

Value

A logical value.

Examples

```
p1 <- mp("x + y + 2 z")
p1 == p1

p2 <- reorder(p1, order = "lex", varorder = c("z","y","x"))
p1 == p2
p2 <- reorder(p1, order = "lex", varorder = c("z","w","y","x"))
p1 == p2
p1 == ( 2 * p2 )

p1 <- mp("x + 1")
p2 <- mp("x + 1")
identical(p1, p2)
p1 == p2

mp("x + 1") == mp("y + 1")
mp("2") == mp("1")
mp("1") == mp("1")
mp("0") == mp("-0")
```

Description

Arithmetic with multivariate polynomials

Usage

```
## S3 method for class 'mpoly'  
e1 + e2  
  
## S3 method for class 'mpoly'  
e1 - e2  
  
## S3 method for class 'mpoly'  
e1 * e2  
  
## S3 method for class 'mpoly'  
e1 ^ e2  
  
## S3 method for class 'mpolyList'  
e1 ^ e2
```

Arguments

e1 an object of class mpoly
e2 an object of class mpoly

Value

object of class mpoly

Examples

```
p <- mp("x + y")  
p + p  
p - p  
p * p  
p^2  
p^10  
  
mp("(x+1)^10")  
p + 1  
2*p
```

mpolyList

Define a collection of multivariate polynomials.

Description

Combine a series of mpoly objects into a mpolyList.

Usage

```
mpolyList(...)
```

Arguments

... a series of mpoly objects.

Value

An object of class mpolyList.

Examples

```
( p1 <- mp("t^4 - x") )
( p2 <- mp("t^3 - y") )
( p3 <- mp("t^2 - z") )
( ms <- mpolyList(p1, p2, p3) )
is.mpolyList(ms)

mpolyList(mp("x + 1"))
p <- mp("x + 1")
mpolyList(p)

ps <- mp(c("x + 1", "y + 2"))
is.mpolyList(ps)

f <- function(){
  a <- mp("1")
  mpolyList(a)
}
f()
```

mpolyListArithmetic *Element-wise arithmetic with vectors of multivariate polynomials.*

Description

Element-wise arithmetic with vectors of multivariate polynomials.

Usage

```
## S3 method for class 'mpolyList'
e1 + e2

## S3 method for class 'mpolyList'
e1 - e2
```

```
## S3 method for class 'mpolyList'
e1 * e2
```

Arguments

- | | |
|----|------------------------------|
| e1 | an object of class mpolyList |
| e2 | an object of class mpolyList |

Value

An object of class mpolyList.

Examples

```
( ms1 <- mp( c("x", 'y') ) )
( ms2 <- mp( c("y", '2 x^2') ) )
ms1 + ms2
ms1 - ms2
ms1 * ms2
ms1^3
```

partitions

Enumerate the partitions of an integer

Description

Determine all unrestricted partitions of an integer. This function is equivalent to the function parts in the partitions package.

Usage

```
partitions(n)
```

Arguments

- | | |
|---|------------|
| n | an integer |
|---|------------|

Value

a matrix whose rows are the n-tuples

Author(s)

Robin K. S. Hankin, from package partitions

Examples

```
partitions(5)
str(partitions(5))
```

permutations

Determine all permutations of a set.

Description

An implementation of the Steinhaus-Johnson-Trotter permutation algorithm.

Usage

```
permutations(set)
```

Arguments

set	a set
-----	-------

Value

a matrix whose rows are the permutations of set

Examples

```
permutations(1:3)
permutations(c('first','second','third'))
permutations(c(1,1,3))
apply(permutations(letters[1:6]), 1, paste, collapse = '')
```

plot.mpoly

Plot the (real) variety of a polynomial

Description

The variety must have only 2 variables; it is plotted over a finite window; and it will not discover zero-dimensional components.

Usage

```
## S3 method for class 'mpoly'
plot(x, xlim, ylim, varorder, add = FALSE, n = 251, nx
= n, ny = n, f = 0.05, col = "red", ...)
```

Arguments

x	an mpoly object
xlim, ylim	numeric(2) vectors; x and y limits
varorder	character(2); first element is x, second is y, defaults to sort(vars(poly))
add	logical; should the plot be added to the current device?
n, nx, ny	integer specifying number of points in the x and y dimensions
f	argument to pass to <code>extendrange()</code>
col	color of curve
...	arguments to pass to <code>contour()</code>

Value`NULL`**Examples**

```

p <- mp("x^2 + y^2 - 1")
plot(p, xlim = c(-1, 1), ylim = c(-1, 1))
plot(p, xlim = c(-1, 1), ylim = c(-1, 1), asp = 1)

p <- mp("x^2 + 16 y^2 - 1")
plot(p, xlim = c(-1, 1), ylim = c(-1, 1))

plot(lissajous(5, 5, 0, 0), col = "black", add = TRUE)

```

plug*Switch indeterminates in a polynomial***Description**

Switch indeterminates in a polynomial

Usage

```
plug(p, indeterminate, value)
```

Arguments

p	a polynomial
indeterminate	the indeterminate in the polynomial to switch
value	the value/indeterminate to substitute

Value

an mpoly object

Examples

```
# on an mpoly
(p <- mp("(x+y)^3"))
plug(p, "x", 5)
plug(p, "x", "t")
plug(p, "x", "y")
plug(p, "x", mp("2 y"))

plug(p, "x", mp("x + y"))
mp("((x+y)+y)^3")

# on an mpolyList
ps <- mp(c("x+y", "x+1"))
plug(ps, "x", 1)
```

predicates	<i>mpoly predicate functions</i>
------------	----------------------------------

Description

Various functions to deal with mpoly and mpolyList objects.

Usage

```
is.constant(x)  
is.mpoly(x)  
is.unipoly(x)  
is.bernstein(x)  
is.bezier(x)  
is.chebyshev(x)  
is.mpolyList(x)  
is.linear(x)
```

Arguments

x object to be tested

Value

Vector of logicals.

Examples

```
p <- mp("5")  
is.mpoly(p)  
is.constant(p)  
  
is.constant(mp(c("x + 1", "7", "y - 2")))  
  
p <- mp("x + y")  
is.mpoly(p)  
  
is.mpolyList(mp(c("x + 1", "y - 1")))
```

```

is.linear(mp("0"))
is.linear(mp("x + 1"))
is.linear(mp("x + y"))
is.linear(mp(c("0", "x + y")))

is.linear(mp("x + x y"))
is.linear(mp(c("x + x y", "x")))

```

```

(p <- bernstein(2, 5))
is.mpoly(p)
is.bernstein(p)

(p <- chebyshev(5))
is.mpoly(p)
is.chebyshev(p)
str(p)

```

print.mpoly*Pretty printing of multivariate polynomials.***Description**

This is the major function used to view multivariate polynomials.

Usage

```
## S3 method for class 'mpoly'
print(x, varorder, order, stars = FALSE, silent =
  FALSE, ..., plus_pad = 2L, times_pad = 1L)
```

Arguments

<code>x</code>	an object of class <code>mpoly</code>
<code>varorder</code>	the order of the variables
<code>order</code>	a total order used to order the monomials in the printing
<code>stars</code>	print the multivariate polynomial in the more computer-friendly asterisk notation (default FALSE)
<code>silent</code>	logical; if TRUE, suppresses output
<code>...</code>	additional parameters to go to <code>base::cat()</code>
<code>plus_pad</code>	number of spaces to the left and right of plus sign
<code>times_pad</code>	number of spaces to the left and right of times sign

Value

Invisible string of the printed object.

Examples

```

mp("-x^5 - 3 y^2 + x y^3 - 1")

(p <- mp("2 x^5 - 3 y^2 + x y^3"))
print(p) # same
print(p, silent = TRUE)
s <- print(p, silent = TRUE)
s

print(p, order = "lex") # -> 2 x^5 + x y^3 - 3 y^2
print(p, order = "lex", varorder = c("y","x")) # -> y^3 x - 3 y^2 + 2 x^5
print(p, varorder = c("y","x")) # -> y^3 x - 3 y^2 + 2 x^5

# this is mostly used internally
print(p, stars = TRUE)
print(p, stars = TRUE, times_pad = 0L)
print(p, stars = TRUE, times_pad = 0L, plus_pad = 1L)
print(p, stars = TRUE, times_pad = 0L, plus_pad = 0L)
print(p, plus_pad = 1L)

```

print.mpolyList

Pretty printing of a list of multivariate polynomials.

Description

This function iterates print.mpoly on an object of class mpolyList.

Usage

```

## S3 method for class 'mpolyList'
print(
  x,
  varorder = vars(x),
  stars = FALSE,
  order,
  silent = FALSE,
  ...,
  plus_pad = 2L,
  times_pad = 1L
)

```

Arguments

x	an object of class mpoly
varorder	the order of the variables

stars	print the multivariate polynomial in the more computer-friendly asterisk notation (default FALSE)
order	a total order used to order the monomials in the printing
silent	logical; if TRUE, suppresses output
...	additional parameters to go to <code>base:::cat()</code>
plus_pad	number of spaces to the left and right of plus sign
times_pad	number of spaces to the left and right of times sign

Value

Invisible character vector of the printed objects.

Examples

```
mL <- mp(c("x + 1", "y - 1", "x y^2 z + x^2 z^2 + z^2 + x^3"))
mL
print(mL, order = "lex")
print(mL, order = "glex")
print(mL, order = "grlex")
print(mL, order = "glex", varorder = c("z", "y", "x"))
print(mL, order = "grlex", varorder = c("z", "y", "x"))
print(mL, varorder = c("z", "y", "x"))

(print(mL, varorder = c("z", "y", "x"), plus_pad = 1L, silent = TRUE))

(print(mL, silent = TRUE, stars = TRUE, plus_pad = 1L, times_pad = 0L))
```

reorder.mpoly

Reorder a multivariate polynomial.

Description

This function is used to set the intrinsic order of a multivariate polynomial. It is used for both the in-term variables and the terms.

Usage

```
## S3 method for class 'mpoly'
reorder(x, varorder = vars(x), order, ...)
```

Arguments

x	an object of class mpoly
varorder	the order of the variables
order	a total order used to order the terms, "lex", "glex", or "grlex"
...	additional arguments

Value

An object of class mpoly.

Examples

```
p <- mp("x y^2 z + x^2 z^2 + z^2 + x^3")
reorder(p) # -> x y^2 z + x^2 z^2 + z^2 + x^3
reorder(p, varorder = c("x", "y", "z"), order = "lex")
# -> x^3 + x^2 z^2 + x y^2 z + z^2
reorder(p, varorder = c("x", "y", "z"), order = "glex")
# -> x^2 z^2 + x y^2 z + x^3 + z^2
reorder(p, varorder = c("x", "y", "z"), order = "grlex")
# -> x y^2 z + x^2 z^2 + x^3 + z^2

reorder(mp("x + 1"), varorder = c("y", "x", "z"), order = "lex")
reorder(mp("x + y"), varorder = c("y", "x", "z"), order = "lex")
reorder(mp("x y + y + 2 x y z^2"), varorder = c("y", "x", "z"))
reorder(mp("x^2 + y x + y"), order = "lex")
```

round.mpoly

*Round the coefficients of a polynomial***Description**

Round the coefficients of an mpoly object.

Usage

```
## S3 method for class 'mpoly'
round(x, digits = 3)
```

Arguments

x	an mpoly object
digits	number of digits to round to

Value

the rounded mpoly object

Author(s)

David Kahle <david@kahle.io>

See Also[mp\(\)](#)**Examples**

```

p <- mp("x + 3.14159265")^4
p
round(p)
round(p, 0)

## Not run:
library(plyr)
library(ggplot2)
library(stringr)

n <- 101
s <- seq(-5, 5, length.out = n)

# one dimensional case
df <- data.frame(x = s)
df <- mutate(df, y = -x^2 + 2*x - 3 + rnorm(n, 0, 2))
qplot(x, y, data = df)
mod <- lm(y ~ x + I(x^2), data = df)
p <- as.mpoly(mod)
qplot(x, y, data = df) +
  stat_function(fun = as.function(p), colour = 'red')

p
round(p, 1)
qplot(x, y, data = df) +
  stat_function(fun = as.function(p), colour = 'red') +
  stat_function(fun = as.function(round(p,1)), colour = 'blue')

## End(Not run)

```

solve_unipoly *Solve a univariate mpoly with polyroot*

Description

Solve a univariate mpoly with polyroot

Usage

```
solve_unipoly(mpoly, real_only = FALSE)
```

Arguments

mpoly	an mpoly
real_only	return only real solutions?

Examples

```
solve_unipoly(mp("x^2 - 1")) # check x = -1, 1
solve_unipoly(mp("x^2 - 1"), real_only = TRUE)
```

swap	<i>Swap polynomial indeterminates</i>
------	---------------------------------------

Description

Swap polynomial indeterminates

Usage

```
swap(p, variable, replacement)
```

Arguments

p	polynomial
variable	the variable in the polynomial to replace
replacement	the replacement variable

Value

a mpoly object

Author(s)

David Kahle

Examples

```
(p <- mp("(x + y)^2"))
swap(p, "x", "t")

## the meta data is retained
(p <- bernstein(3, 5))
(p2 <- swap(p, "x", "t"))
is.bernstein(p2)

(p <- chebyshev(3))
(p2 <- swap(p, "x", "t"))
is.chebyshev(p2)
```

`terms.mpoly` *Extract the terms of a multivariate polynomial.*

Description

Compute the terms of an mpoly object as a mpolyList.

Usage

```
## S3 method for class 'mpoly'
terms(x, ...)
```

Arguments

<code>x</code>	an object of class mpoly
<code>...</code>	additional parameters

Value

An object of class mpolyList.

Examples

```
## Not run: .Deprecated issues a warning

x <- mp("x^2 - y + x y z")
terms(x)
monomials(x)

## End(Not run)
```

`tuples` *Determine all n-tuples using the elements of a set.*

Description

Determine all n-tuples using the elements of a set. This is really just a simple wrapper for expand.grid, so it is not optimized.

Usage

```
tuples(set, n = length(set), repeats = FALSE, list = FALSE)
```

Arguments

set	a set
n	length of each tuple
repeats	if set contains duplicates, should the result?
list	tuples as list?

Value

a matrix whose rows are the n-tuples

Examples

```
tuples(1:2, 3)
tuples(1:2, 3, list = TRUE)

apply(tuples(c("x", "y", "z"), 3), 1, paste, collapse = "")

# multinomial coefficients
r <- 2 # number of variables, e.g. x, y
n <- 2 # power, e.g. (x+y)^2
apply(burst(n,r), 1, function(v) factorial(n)/ prod(factorial(v))) # x, y, xy
mp("x + y")^n

r <- 2 # number of variables, e.g. x, y
n <- 3 # power, e.g. (x+y)^3
apply(burst(n,r), 1, function(v) factorial(n)/ prod(factorial(v)))
mp("x + y")^n

r <- 3 # number of variables, e.g. x, y, z
n <- 2 # power, e.g. (x+y+z)^2
apply(burst(n,r), 1, function(v) factorial(n)/ prod(factorial(v))) # x, y, z, xy, xz, yz
mp("x + y + z")^n
```

Description

Determine the variables in a mpoly object.

Usage

vars(p)

Arguments

p	An mpoly or mpolyList object.
---	-------------------------------

Value

A character vector of the variable names.

Examples

```
p <- mp("x + y^2")
vars(p)

p <- mp(c("x + y^2", "y - 2 x"))
vars(p)
```
