Type Package

Title Conditioned Latin Hypercube Sampling

Version 0.9.2

Date 2025-10-20

Maintainer Pierre Roudier < roudierp@landcareresearch.co.nz>

URL https://github.com/pierreroudier/clhs/

BugReports https://github.com/pierreroudier/clhs/issues

Description Conditioned Latin hypercube sampling, as published by Minasny and McBratney (2006) <DOI:10.1016/j.cageo.2005.12.009>. This method proposes to stratify sampling in presence of ancillary data. An extension of this method, which propose to associate a cost to each individual and take it into account during the optimisation process, is also proposed (Roudier et al., 2012, <DOI:10.1201/b12728>).

Depends R (>= 2.14.0)

Imports utils, methods, grid, ggplot2, sf, raster, reshape2, plyr, cluster, Rcpp

Description

This package implements the conditioned Latin hypercube sampling, as published by Minasny and McBratney (2006) and the DLHS variant method (Minasny and McBratney, 2010).. This method proposes to stratify sampling in presence of ancillary data.

Details

An extension of this method, which propose to associate a cost to each individual and take it into account during the optimisation process, is also proposed (Roudier et al., 2012).

Conditioned Latin Hypercube Sampling

Description

Implementation of the conditioned Latin hypercube sampling, as published by Minasny and McBratney (2006) and the DLHS variant method (Minasny and McBratney, 2010). These methods propose to stratify sampling in presence of ancillary data. An extension of this method, which propose to associate a cost to each individual and take it into account during the optimisation process, is also proposed (Roudier et al., 2012).

Usage

```
clhs(
  х,
  size,
  must.include,
  can.include,
  cost,
  iter,
  use.cpp,
  temp,
  tdecrease,
  weights,
  eta,
  obj.limit,
  length.cycle,
  simple,
  progress,
  track,
  use.coords,
)
```

4 clhs

Arguments

A data. frame, SpatialPointsDataFrame, sf, or Raster object. Х size A non-negative integer giving the total number of items to select must.include A numeric vector giving the indices of the rows from x that must be included in the selected items. For the cost-constrained cLHS method, cost of these mandatory samples is set to 0. If NULL (default), all data are randomly chosen according to the classic cLHS method. If must.include is not NULL, argument size must include the total size of the final sample i.e. the size of mandatory samples given by must.include plus the size of the randomly chosen samples to pick. A numeric vector giving indices of the rows from x that are allowed to be samcan.include pled from. The algorithm will use all of x as the reference distribution, but will only select samples from possible sample. The option is only available in the C++ version; if use.cpp == FALSE, this parameter will be ignored. cost A character giving the name or an integer giving the index of the attribute in x that gives a cost that can be use to constrain the cLHS sampling. If NULL (default), the cost-constrained implementation is not used. A positive number, giving the number of iterations for the Metropolis-Hastings iter annealing process. Defaults to 10000. TRUE or FALSE. If set to TRUE, annealing process uses C++ code. This is use.cpp ~ 150 times faster than the R version, but is less stable and currently doesn't accept track or obj.limit parameters. Default to TRUE. The initial temperature at which the simulated annealing begins. Defaults to 1. temp tdecrease A number between 0 and 1, giving the rate at which temperature decreases in the simulated annealing process. Defaults to 0.95. weights A list a length 3, giving the relative weights for continuous data, categorical data, and correlation between variables. Defaults to list(numeric = 1, factor = 1, correlation = 1). Either a number equal 1 to perform a classic cLHS or a constrained cLHS or eta a matrix to perform a cLHS that samples more on the edge of the distibutions (DLHS, see details) obj.limit The minimal value at which the optimisation is stopped. Defaults to -Inf. length.cycle The duration (number of iterations) of the isotemperature steps. Defaults to 10. simple TRUE or FALSE. If set to TRUE, only the indices of the selected samples are returned, as a numeric vector. If set to FALSE, a cLHS_result object is returned (takes more memory but allows to make use of cLHS_results methods such as plot.cLHS_result). TRUE or FALSE, displays a progress bar. progress track A character giving the name or an integer giving the index of the attribute in x that gives a cost associated with each individual. However, this method will only track the cost - the sampling process will not be constrained by this attribute. If NULL (default), this option is not used. use.coords Logical, if TRUE the spatial coordinates of supported spatial objects (either a 'SpatialPointsDataFrame' object if using 'sp', or a 'sf' object if using 'sf') are

included in the Latin hypercube calculations. Defaults to FALSE.

.. additional parameters passed to clhs

clhs 5

Details

For the DLHS method, the original paper defines parameter b as the importance of the edge of the distributions. A matrix eta (size N x K, where N is the size of the final sample and K the number of continuous variables) is defined, to compute the objective function of the algorithm, where each column equal the vector (b, 1, ..., 1, b) in order to give the edge of the distribution a probability b times higher to be sampled. In our function, instead of define the b parameter, users can defined their own eta matrix so that they can give more complex probability design of sampling each strata of the distribution instead of just be able to give more importance to both edges of the distribution.

Value

* If the simple option is set to TRUE (default behaviour): A numeric vector containing the indices of the selected samples is returned

* If the simple option is set to FALSE: An object of class cLHS_result, with the following elements:

index_samples a vector giving the indices of the chosen samples.

sampled_data the sampled data.frame.

obj a vector giving the evolution of the objective function throughout the Metropolis-

Hastings iterations.

cost a vector giving the evolution of the cost function throughout the Metropolis-

Hastings iterations (if available).

plot(res)
# Method DLHS with a linear increase of the strata weight (i.e. probability to be sampled)
# from 1 for the middle starta to 3 for the edge of the distribution
linear_increase <- 1+(2/24)*0:24
eta <- matrix(c(rev(linear_increase), linear_increase), ncol = 2, nrow = 50)</pre>
set.seed(1)
res <- clhs(df, size = 50, iter = 100, eta = eta, progress = FALSE, simple = FALSE)
str(res)
plot(res)
```

cLHS_result

Conditioned Latin Hypercube Sampling result

Description

A S3 class describing a cLHS result.

Value

An object of class cLHS_result contains the following slots:

index_samples a vector giving the indices of the chosen samples.

sampled_data the sampled data.frame.

obj a vector giving the evolution of the objective function throughout the Metropolis-

Hastings iterations.

cost a vector giving the evolution of the cost function throughout the Meropolis-

Hastings iterations, if available, otherwise NULL.

clhs

CppLHS This is the internal Cpp function used to run the metropolis hasting algorithm if use.cpp = T. In general, it shouldn't be used as a stand alone function, because some preprocessing is done in R

Description

This is the internal Cpp function used to run the metropolis hasting algorithm if use.cpp = T. In general, it shouldn't be used as a stand alone function, because some preprocessing is done in R

Arguments

xA matrix of data - must be numeric (factors are converted to numeric in R)

cost cost vector (0 if no cost)
strata matrix of continuous strata
include matrix of included data

idx integer vector of rows from which sampling is allowed

 $\begin{array}{ll} \mbox{factors} & \mbox{boolean factor flag} \\ \mbox{i_fact} & \mbox{indices of factors in } xA \\ \mbox{nsample} & \mbox{number of samples} \\ \end{array}$

cost_mode bool cost flag

iter number of iterations
wCont continuous weight
wFact factor weights

wCorr correlation weights

etaMat eta matrix - either all 1, or user input

temperature initial temperature

tdecrease temperature decrease every length_cycle iterations length_cycle number of iterations between temperature decrease

Value

list with sampled data, indices, objective values, cost value, and final continuous weights for each sample

8 plot.cLHS_result

plot.cLHS_result

Plot cLHS results

Description

Produces a plot illustrating the result of a cLHS sampling procedure.

Usage

```
## S3 method for class 'cLHS_result'
plot(x, modes = "obj", ...)
```

Arguments

x Object of class "cLHS_result".
 modes A character vector describing the plot to produce (see Details)
 ... Other ggplot2 plotting parameters.

Details

The subplots to be included in the final illustration are controlled by the mode option: - "obj" adds the evolution of the objective function over the iterations - "cost" adds the evolution of the cost function over the iterations (if available in x) - "hist" adds the comparison of the distributions of each variables in both the original object and the sampled result using histogram plots (for continuous variables). - "dens" adds the comparison of the distributions of each variables in both the original object and the sampled result using density plots (for continuous variables). - "box" adds the comparison of the distributions of each variables in both the original object and the sampled result using boxplots (for continuous variables).

Examples

```
df <- data.frame(
    a = runif(1000),
    b = rnorm(1000),
    c = sample(LETTERS[1:5], size = 1000, replace = TRUE)
)

res <- clhs(df, size = 50, iter = 1000, use.cpp = FALSE, progress = FALSE, simple = FALSE)

# You can plot only the objective function</pre>
```

similarity_buffer 9

```
plot(res, mode = "obj")
# Or you can compare the distribution in the original object
# and in the sampled result
plot(res, mode = c("obj", "box"))
```

similarity_buffer

Gower similarity analysis

Description

Calculates Gower's similarity index for every pixel within an given radius buffer of each sampling point

Usage

```
similarity_buffer(
  covs,
  pts,
  buffer,
  fac = NA,
  metric = "gower",
  stand = FALSE,
   ...
)
```

Arguments

covs	raster stack of environmental covariates
pts	sampling points, object of class SpatialPointsDataframe
buffer	Radius of the disk around each point that similarity will be calculated
fac	numeric, can be > 1 , (e.g., fac = $c(2,3)$). Raster layer(s) which are categorical variables. Set to NA if no factor is present
metric	character string specifying the similarity metric to be used. The currently available options are "euclidean", "manhattan" and "gower" (the default). See daisy from the cluster package for more details
stand	logical flag: if TRUE, then the measurements in \boldsymbol{x} are standardized before calculating the dissimilarities.
	passed to plyr::llply

Value

a RasterStack

similarity_buffer
